Doug West*

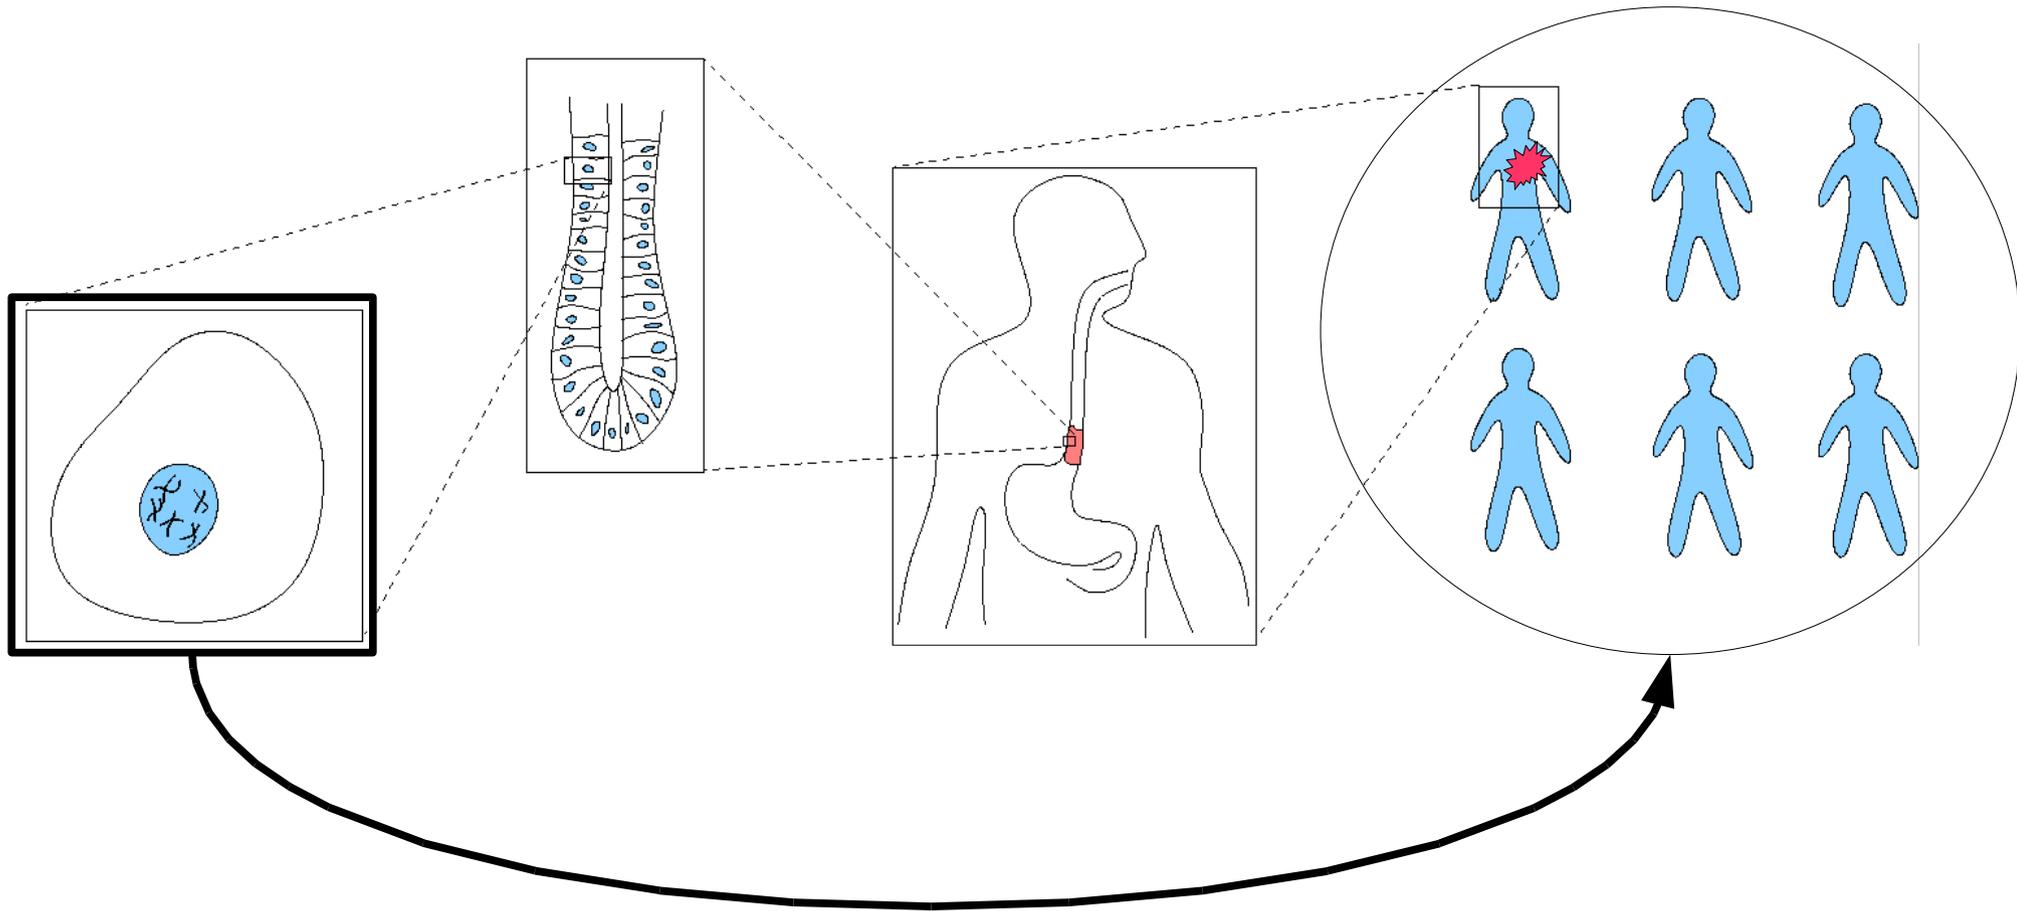

Scales of neoplastic progression:

example: Barrett's esophagus

first attempts (1950's)

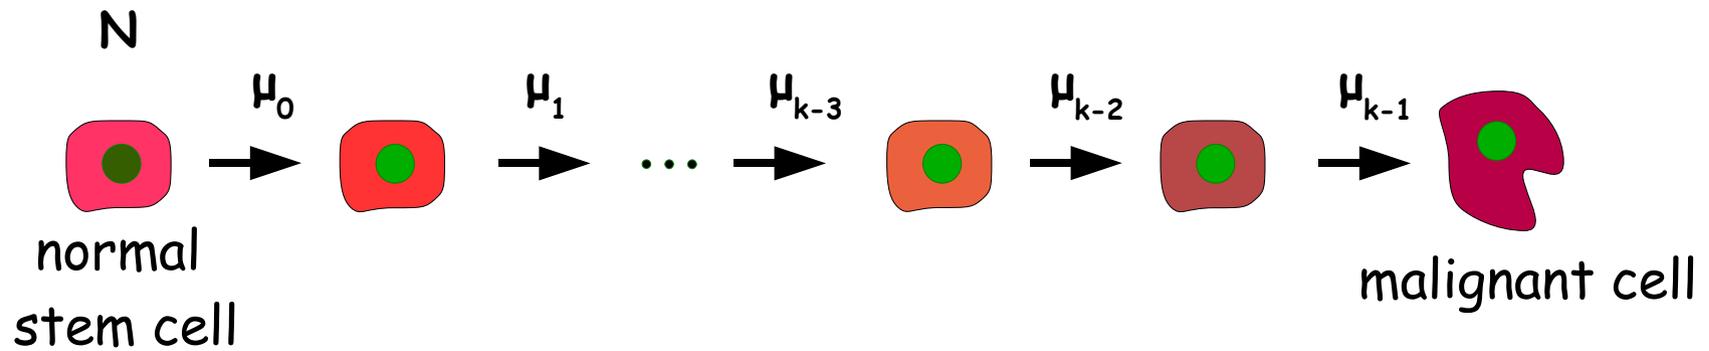

acquisition of requisite mutations,
(LOH, translocations, amplifications, DNA (hyper)methylation,...)

multistage carcinogenesis

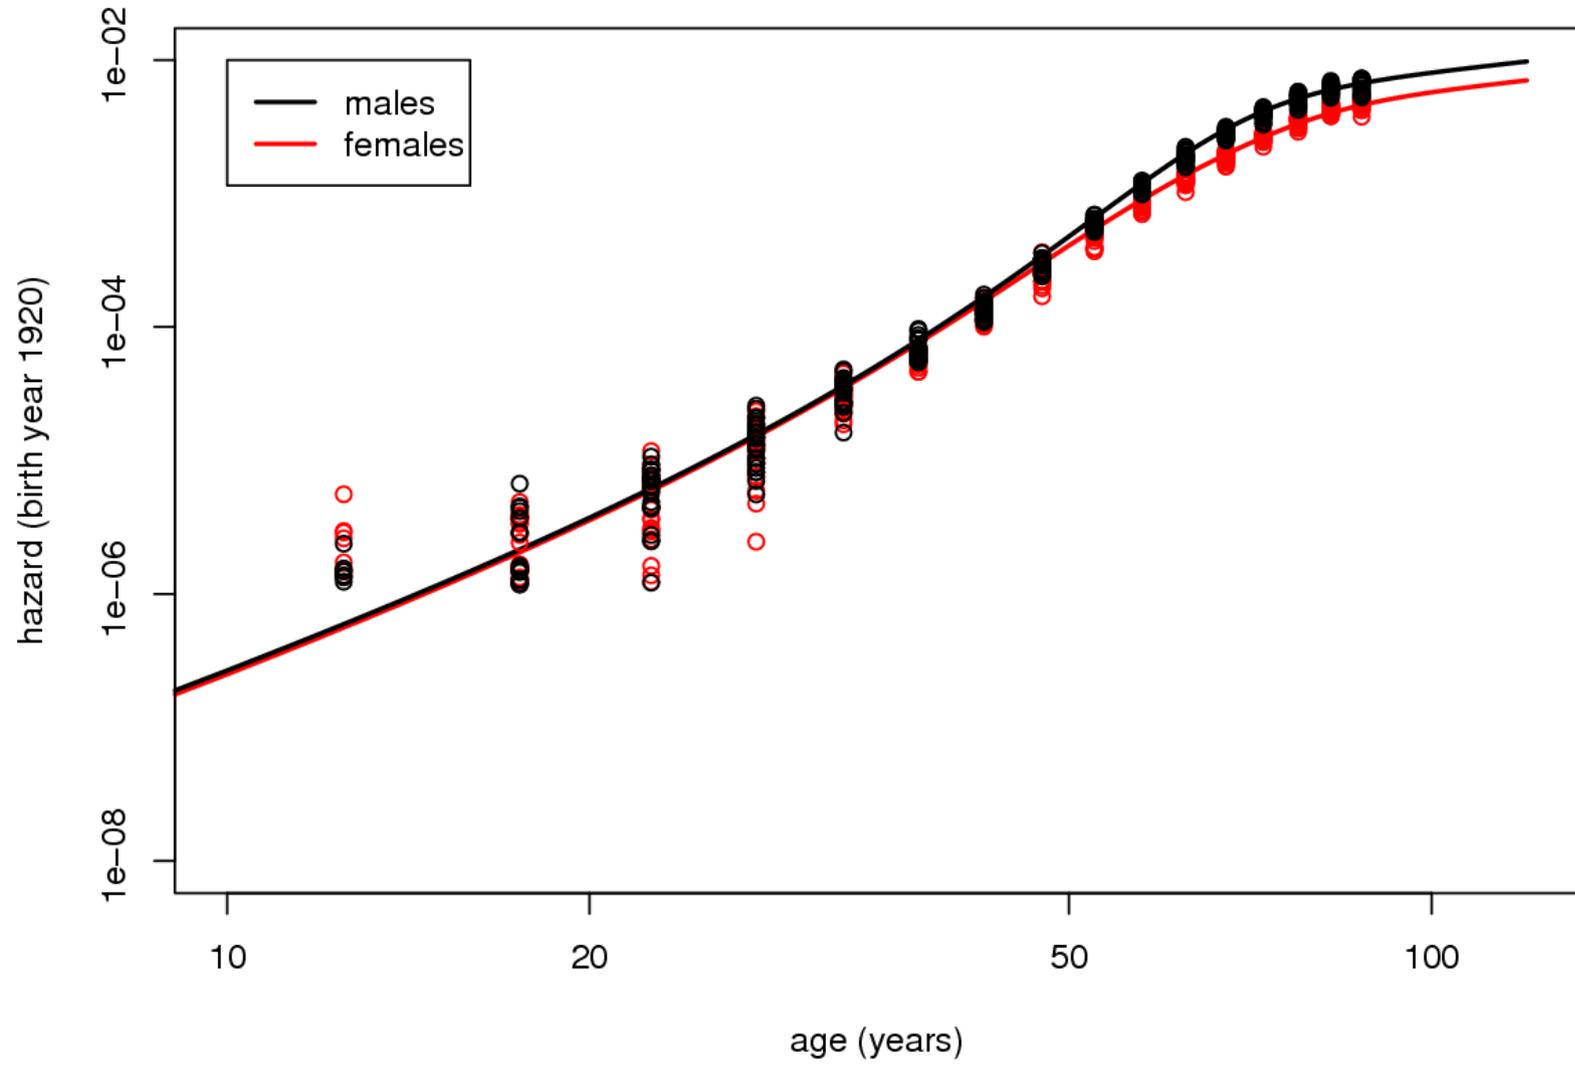

(Armitage & Doll, Nordling - 1950's)

age-specific incidence $I(a) \approx a^{k-1}$

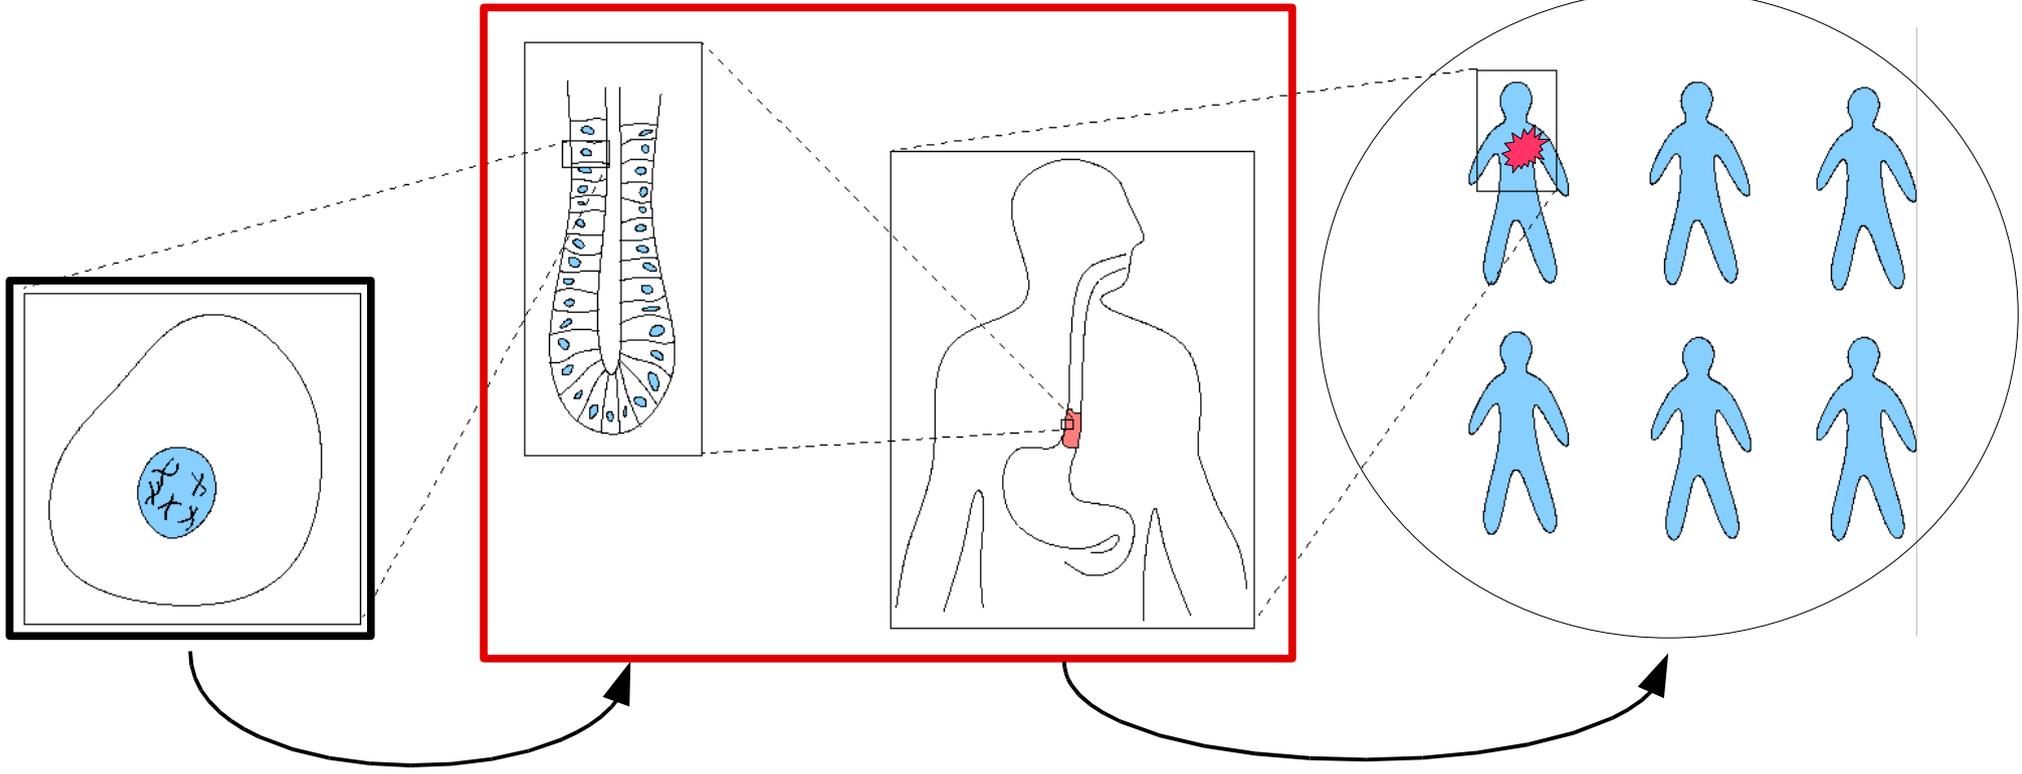

SEER (1973-2000) colorectal cancer

neoplastic progression

acquisition of (epi)genetic events
leading to neoplastic alterations in
cellular organization

tumor progression & clinical detection

spatial & temporal scales:

compartments

parameters

stem cells _____ mutation rates

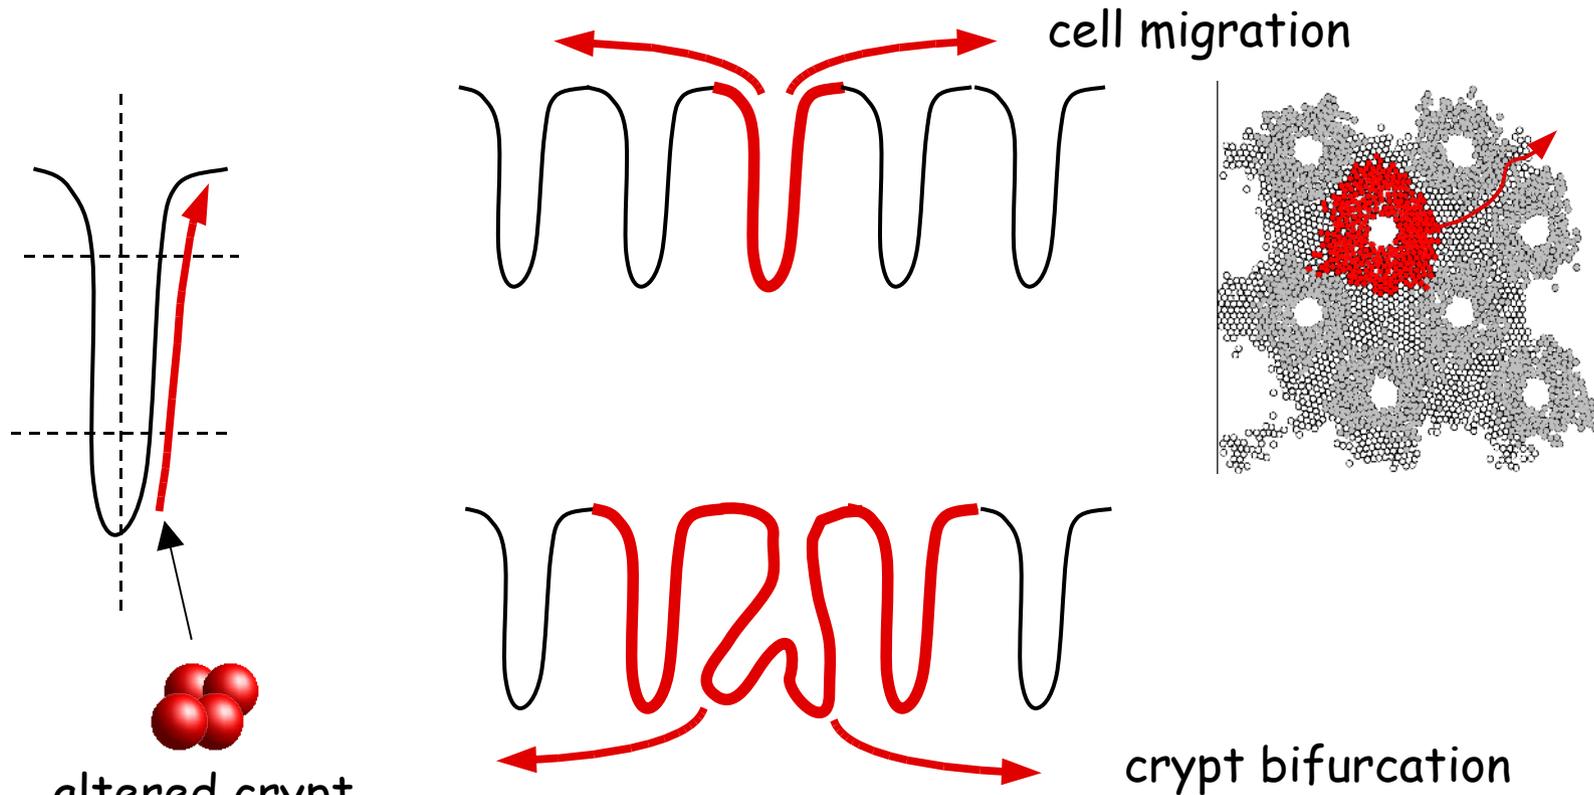

stem cell niche _____ time to fixation or extinction

tissue level _____ cell kinetic parameters

(birth and death rates)

population level _____ incidence rates (hazard fct)

we don't know how clones expand across crypt structured tissue

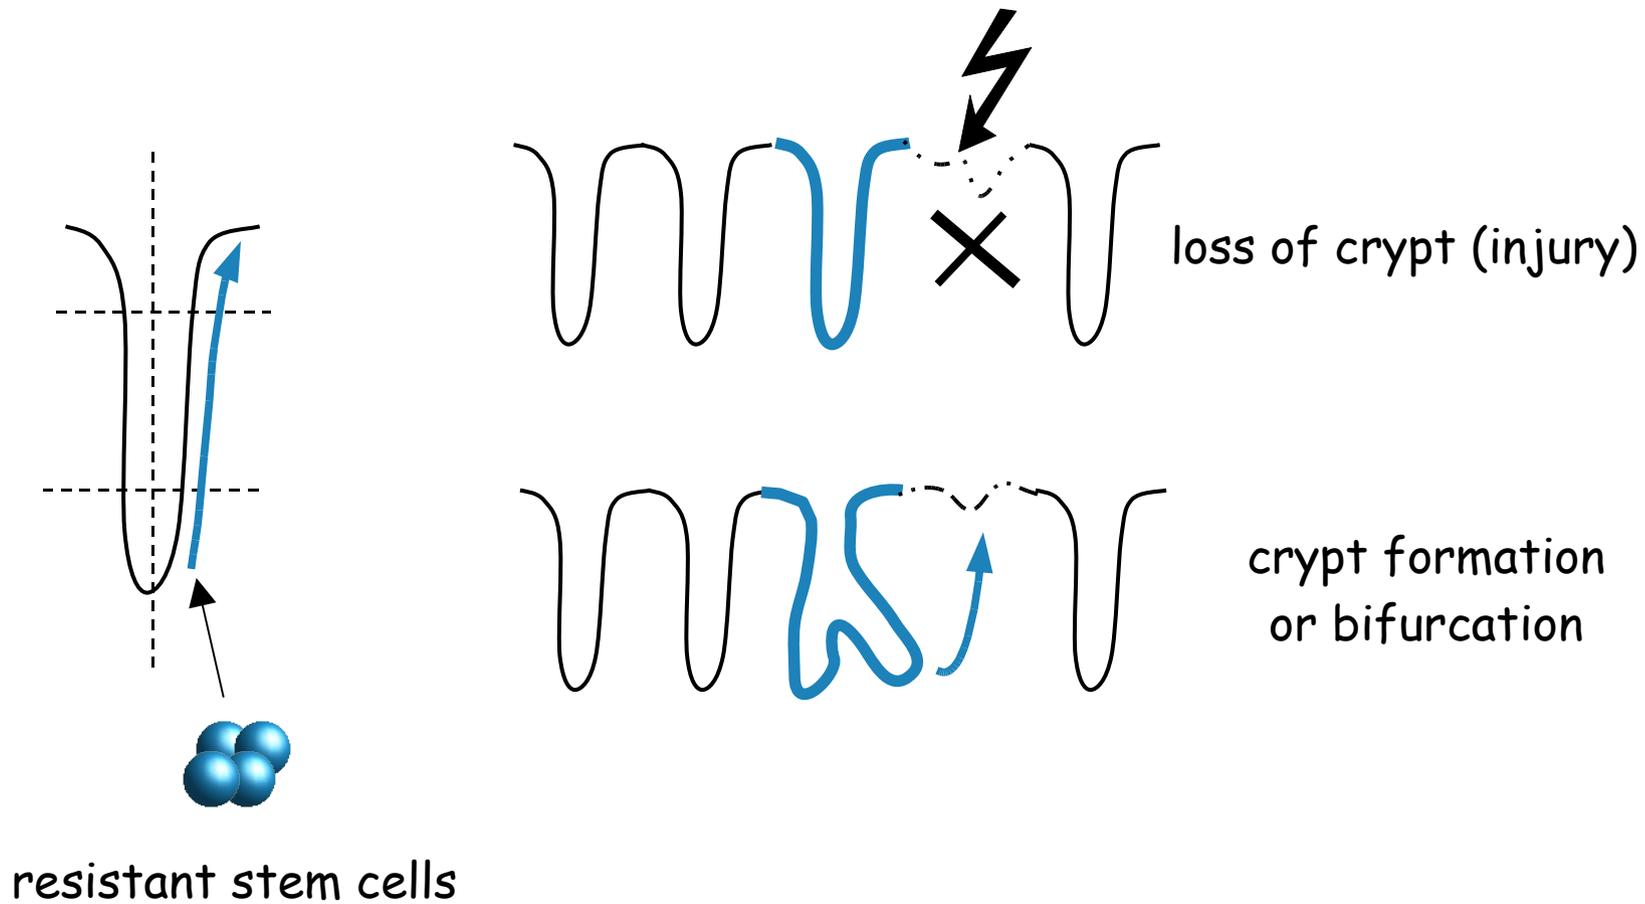

altered crypt
with
reproductive
or survival
advantage

**carcinogenesis is virtually impossible
without clonal expansion**

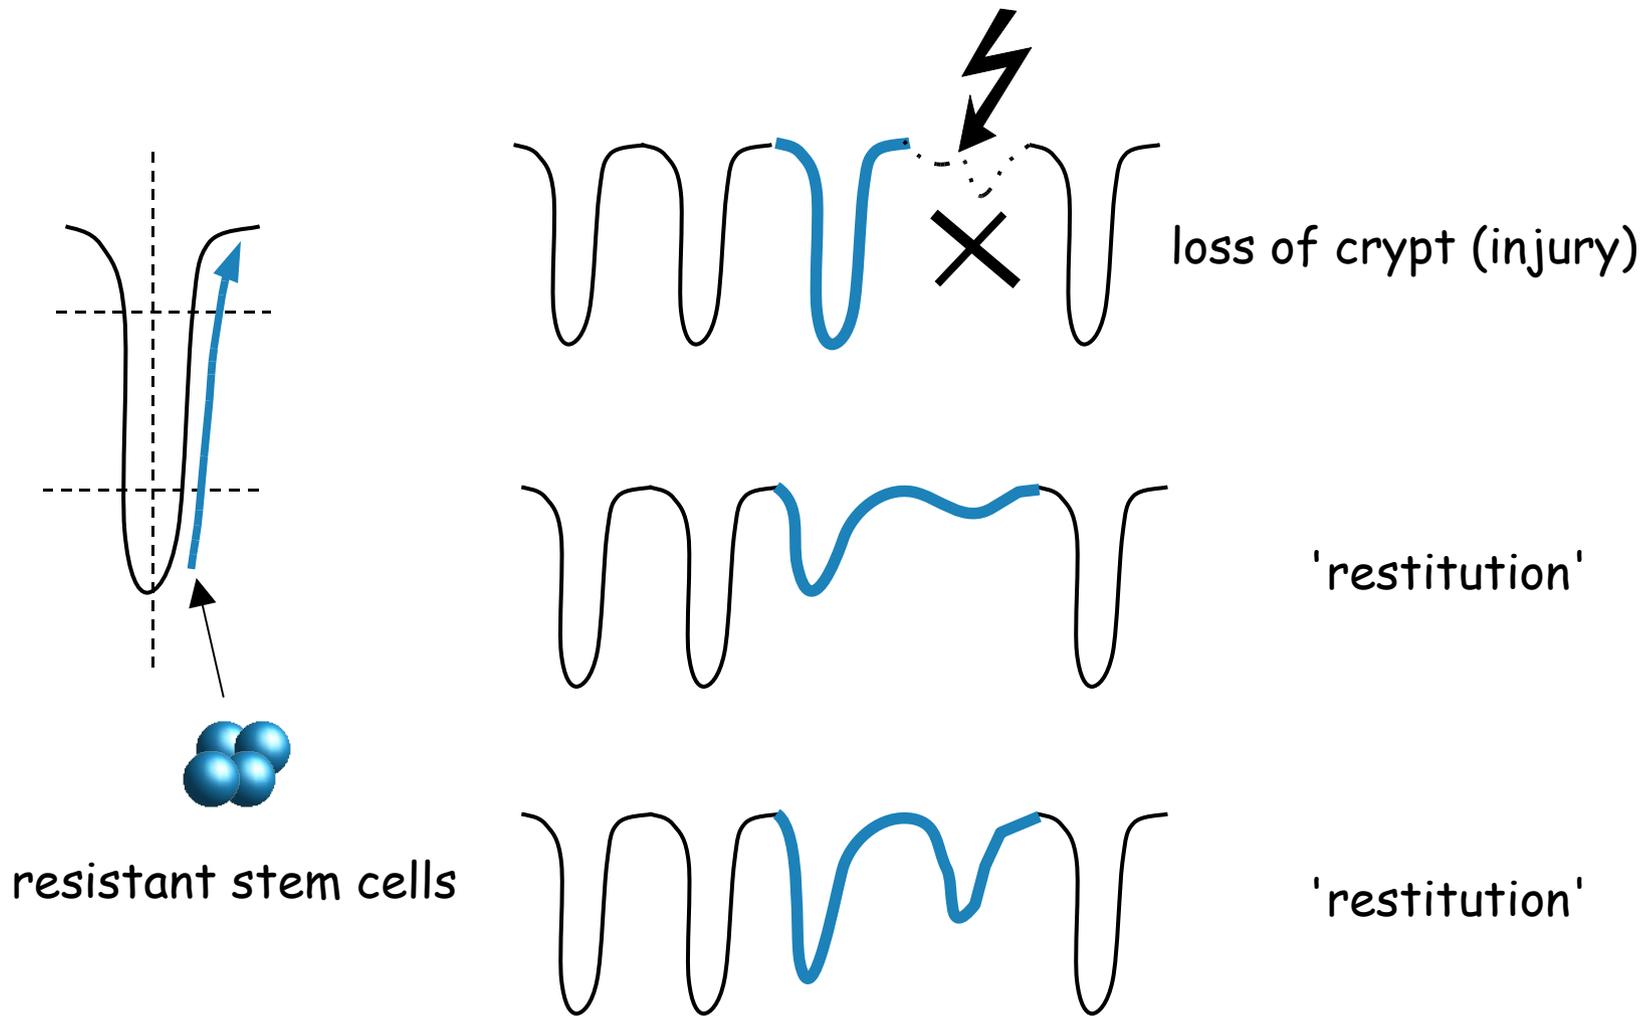

clonal expansion of (injury)resistant population

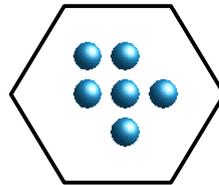

clonal expansion of (injury)resistant population

connecting the scales

module 1: from a cell to a proliferative unit (Potten, Loeffler,...)

questions:

1. how are crypts organized?

Number(distribution) of stem cells

Stem cell kinetics

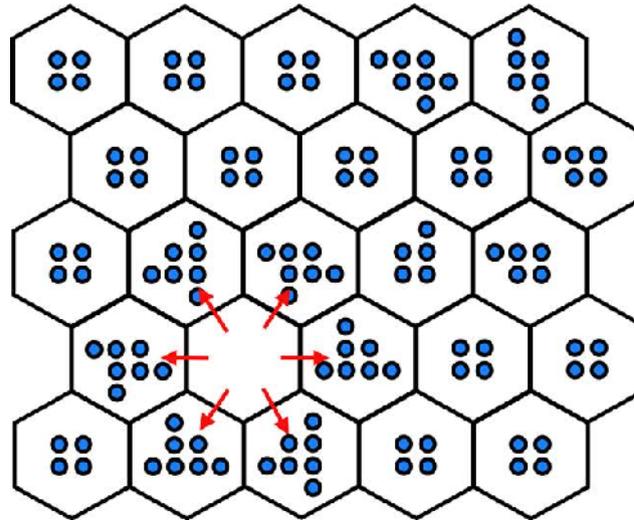

Homeostatic regulation/differentiation (David Birtwell)

2. how do mutant cells fare in a crypt that undergoes cell turnover (extinction/fixation)?

3. number of rate-limiting events to 'initiation'? (Jihyoun Jeon)

connecting the scales

module 2: from a proliferative unit to a tissue unit (organ)

David Birtwell
Dennis Chao
Tom Eck

questions:

1. how do the number of stem cells per crypt affect carcinogenesis?
2. how does the proportion of deleterious to advantageous mutations affect carcinogenesis?

(see David Birtwell's poster)

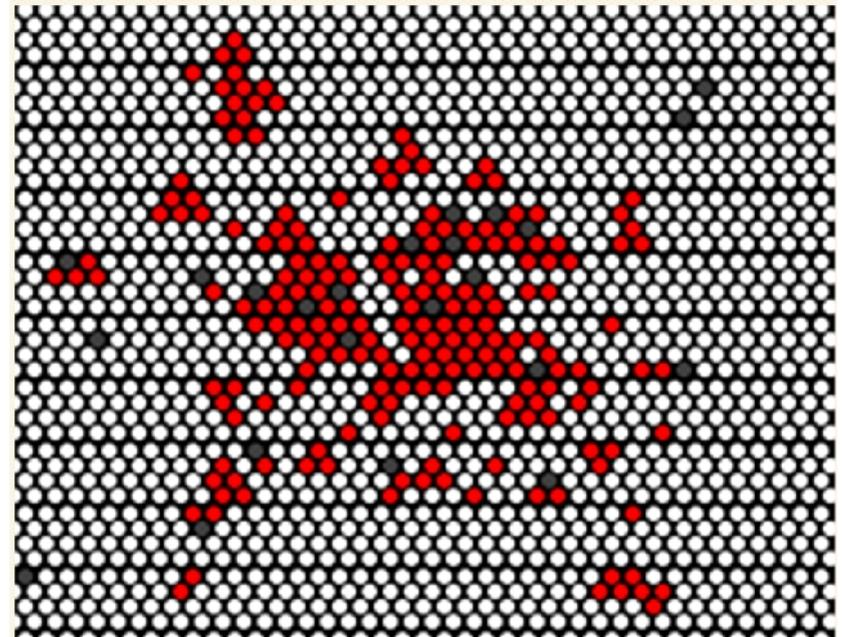

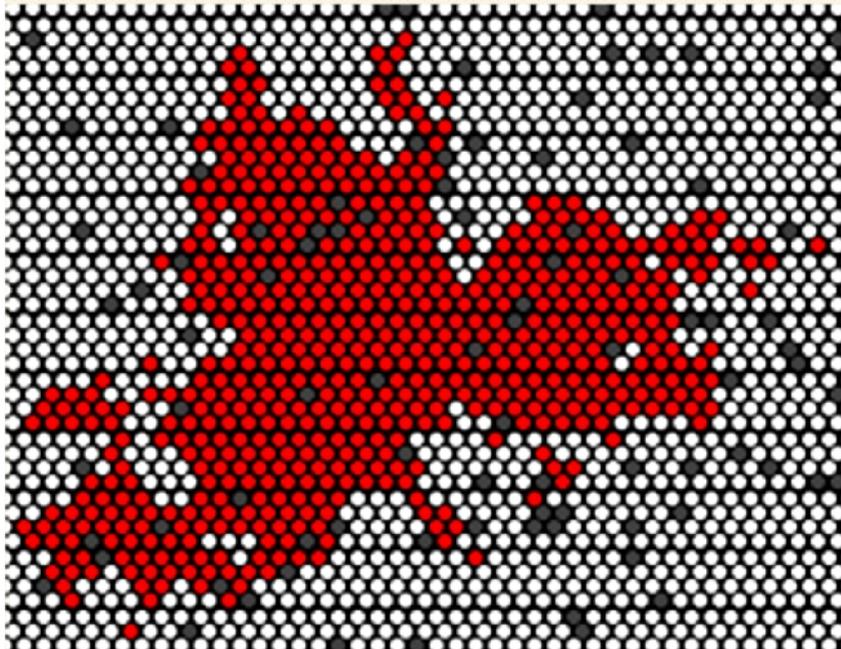

connecting the scales

module 2: from a proliferative unit to a tissue unit (organ)

questions:

1. what can the shape of clones tell us?

(see Tom Eck's poster)

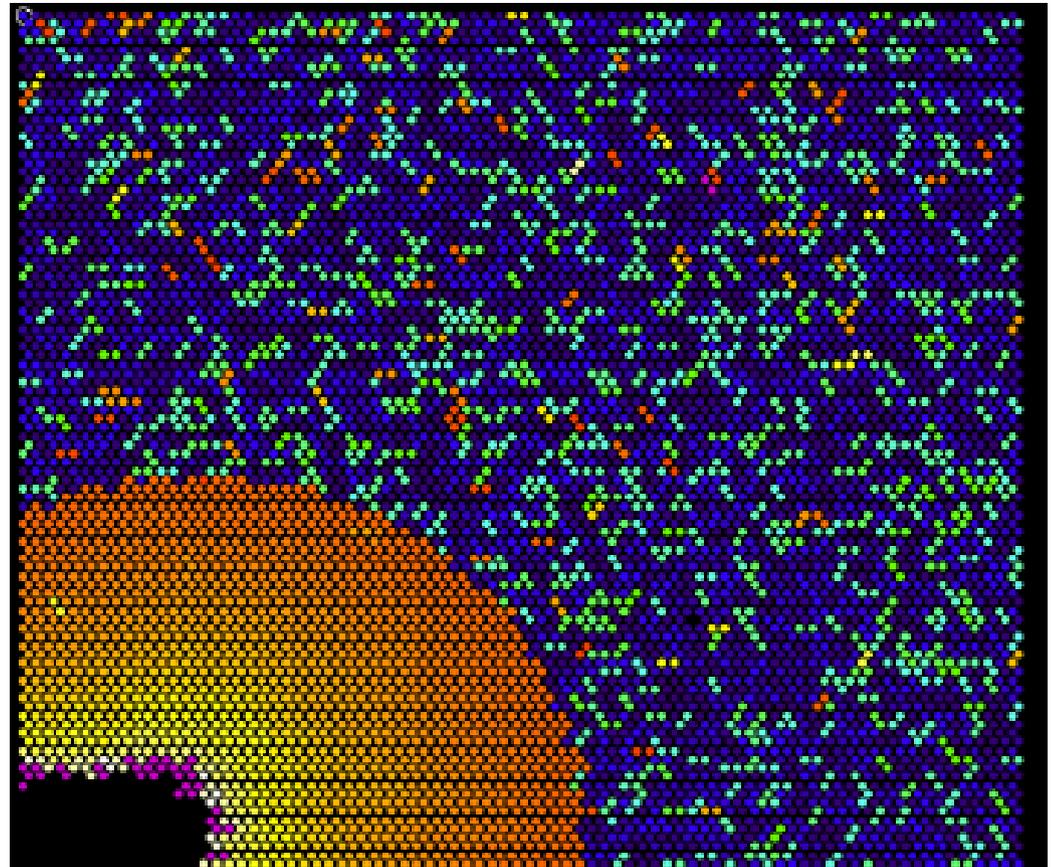

connecting the scales

module 2: from a proliferative unit to a tissue unit (organ)

questions:

1. can the genetic distance between proliferative units reveal the history and mechanism of wounding?

(see Doug West's poster)

connecting the scales

module 3: from a tissue unit to cancer in populations

(tumor progression, invasion, detection, screening)

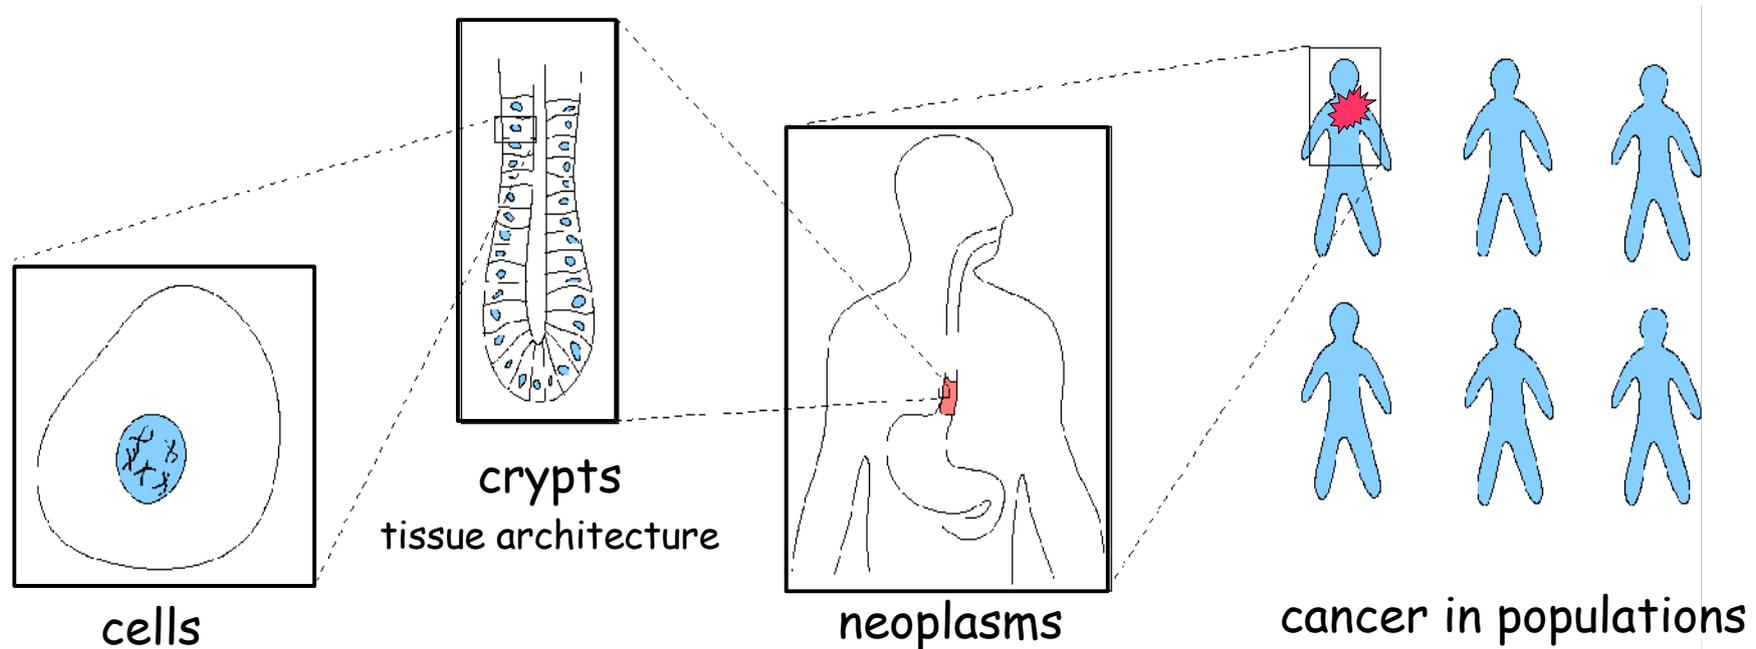

questions:

1. what modifies cancer incidence rates (effect modifiers, trends)?
2. what is the prevalence of individuals at specific stages in carcinogenesis?

Use model to improve cancer screening/surveillance.

(see Jihyoun Jeon's poster)

Significance of modeling neoplastic progression

- **generating hypotheses for phenomena in carcinogenesis**
- **guiding experiments**
- **focusing interventions on parameters that have the greatest effect on carcinogenesis**

example: colon cancer
