

Stochastic Simulation at Your Service

Linda Petzold

University of California Santa Barbara

Outline

- ▶ Stochastic effects in biological systems
 - ▶ Brief review of discrete stochastic simulation for well-mixed systems
 - ▶ StochKit2 software for well-mixed systems
 - ▶ Spatial stochasticity in biological systems
 - ▶ Spatial stochastic simulation
 - ▶ PyURDME
 - ▶ StochSS
 - ▶ Future plans
- 

Stochasticity in Biochemical Systems

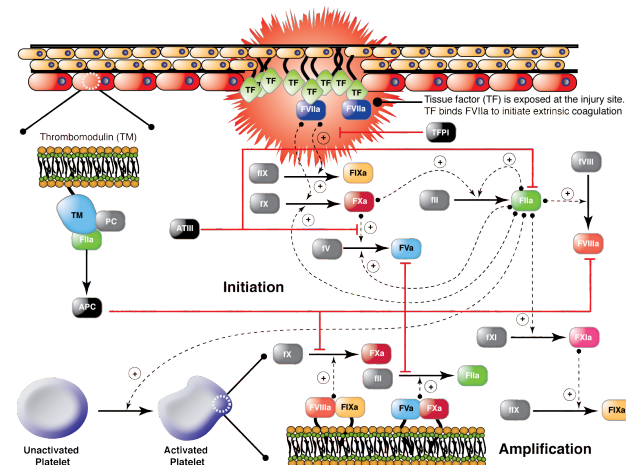

Small populations of key chemical species give rise to stochastic behavior

Intrinsic stochasticity revealed by experiment

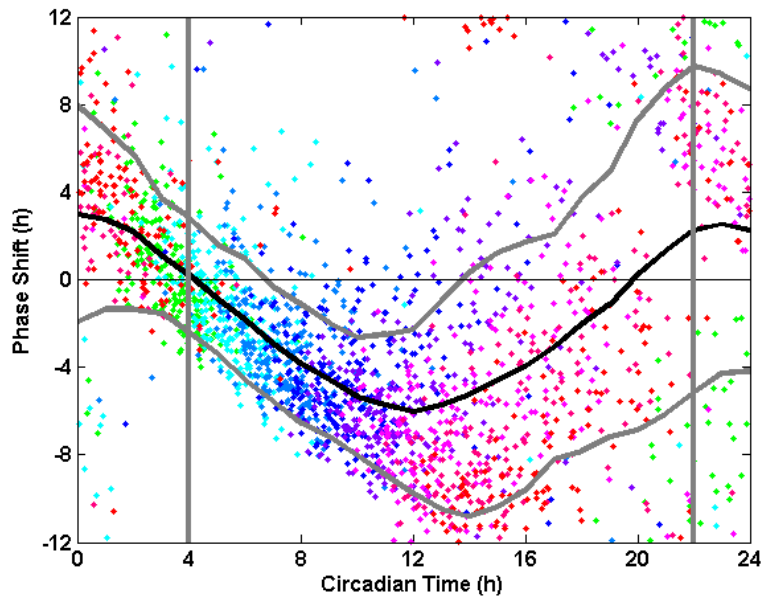

*Elowitz M B et al. Science
2002;297:1183-1186
©2002 by AAAS*

Coagulation cascade

Stochastic Effects

Circadian rhythm: phase response distribution

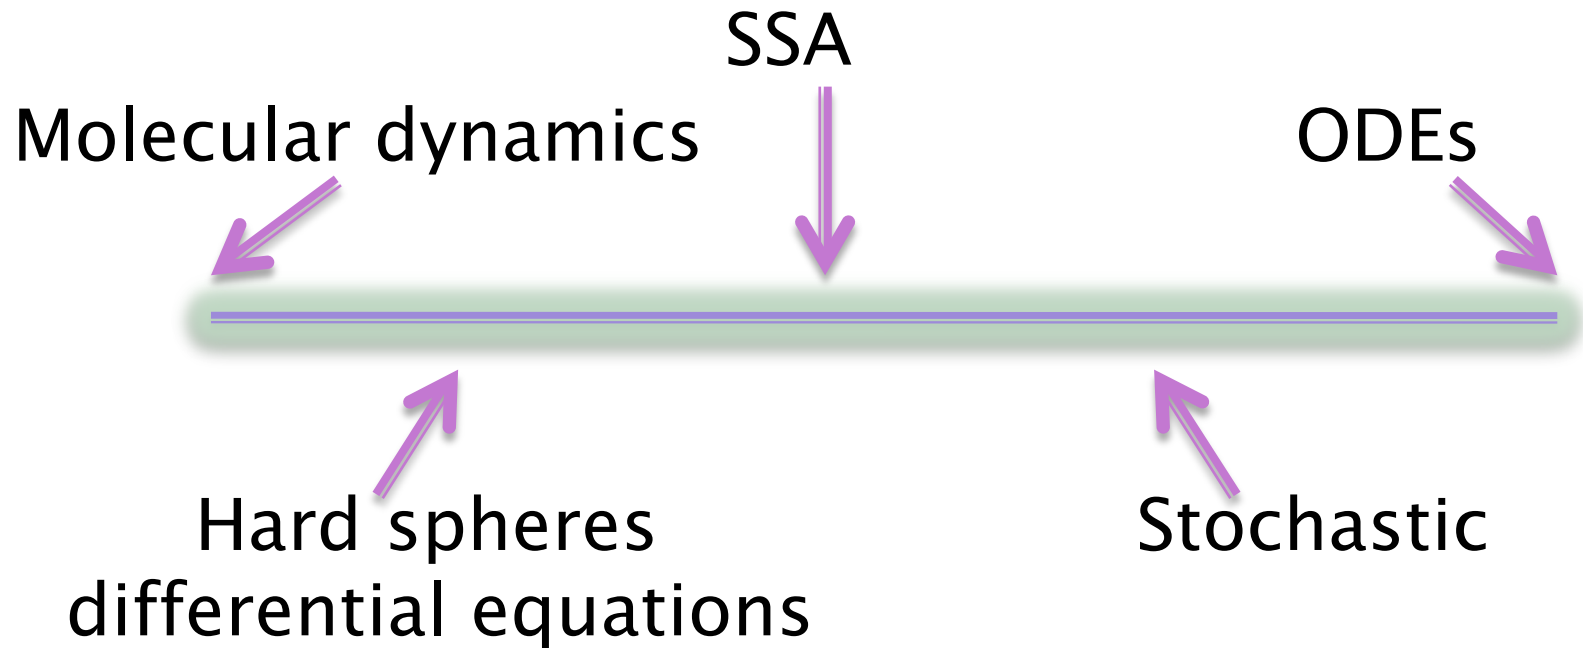

An et al., PNAS 2013

Extinction

Spectrum of chemical reaction simulation regimes

Discrete Stochastic Simulation

- ▶ Stochastic Simulation Algorithm (SSA) for well-mixed, chemically reacting systems (*Gillespie, 1976*)
- ▶ Virtually fire each reaction event according to its propensity (probability)

- ▶ A large ensemble of these simulations must be computed to estimate the pdfs with even modest accuracy

Properties of Discrete Stochastic Models

- ▶ Stochastic (mass-action) model converges to the corresponding deterministic model, in the thermodynamic limit
- ▶ There is often no need to include non-physical terms such as highly nonlinear Hill kinetics or delays, to explain experimental results
- ▶ Stochastic model captures the intrinsic variability in system response – Important for coupled models and medical applications

Algorithms for Discrete Stochastic Simulation of Well-Mixed Chemical Systems

▶ Fast formulations of SSA

- *Next Reaction method (Gibson & Bruck, 2000), Optimized Direct Method (Li & Petzold, 2004), Sorting Direct Method (McCollum et al., 2004), Logarithmic Direct Method (Li & Petzold, 2006), Constant Time Method (Slepoy et al., 2008), SSA on GPU (Li & Petzold, 2009)*

▶ Tau leaping *(Gillespie, 2001)*

- *Implicit (Rathinam et al., 2003), R-leaping (Auger et al., 2006), adaptive stepsize selection and preservation of non-negativity (Cao et al. 2006), unbiased post-leap rejection (Anderson 2008)*

▶ Hybrid SSA/ODE

- *(Haseltine & Rawlings, 2002), (Mattheyses, Kiehl & Simmons, 2002), (Puchalka & Kierzek, 2004), (Salis & Kaznessis, 2005)*

▶ Slow scale/multiscale SSA

- *(Cao, Gillespie & Petzold, 2005)*

▶ *Multilevel Monte Carlo*

- *(Anderson & Higham, 2012)*

StochKit2

Stochastic Simulation Toolkit

▶ Features:

- StochKitML: Simple XML-based model input
- SSA driver automatically selects the fastest solver
- Tau-leaping driver adaptively selects stepsize, preserves nonnegativity, and dynamically switches to SSA when tau-leaping is not advantageous
- Event handling
- Automatic parallelism utilizes multi-core technology
- Flexible output options: trajectories, statistics, histograms

▶ Tools

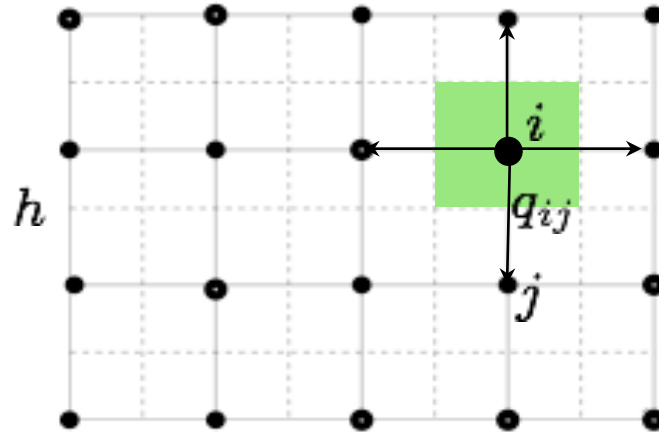

- Convert SBML models to StochKitML format
- Display histograms and trajectories using Matlab-compatible functions

Spatial Stochastic Simulation

- ▶ Morphogenesis
- ▶ Polarization
- ▶ Chemotaxis

Inhomogeneous SSA (ISSA)

Introduce a discretization of the domain into subvolumes (voxels) and assume that the well-stirred assumption is fulfilled within each subvolume (green). Diffusion is introduced as jumps from one subvolume to adjacent subvolumes.

Cartesian, uniform mesh: $q_{ij} = \frac{\gamma}{h^2} \quad X_i \xrightarrow{q_{ij}} X_j$

Fundamental Issues and Complications

- ▶ The limit $h \rightarrow 0$ is not attainable for physical reasons. Must choose the mesh parameter h to be small enough to capture the desired features of the system, but large enough so that the system is well-mixed in each grid cell

Elf & Ehrenberg, 2004

- ▶ For reaction-diffusion systems, for small enough h , molecules never react!

Isaacson, 2009

- ▶ Theory and proposed improvement on algorithm

Erban & Chapman, 2009; Fange & Elf, 2011

Hellander, Hellander & Petzold, 2012; Isaacson, 2013

- ▶ Propensities vary with molecular crowding, roughly as a function of the size of the molecules

Lampoudi, Gillespie, Petzold, 2007, 2009; Ellis, 2001; Despa, 2009

Simulation of Diffusion

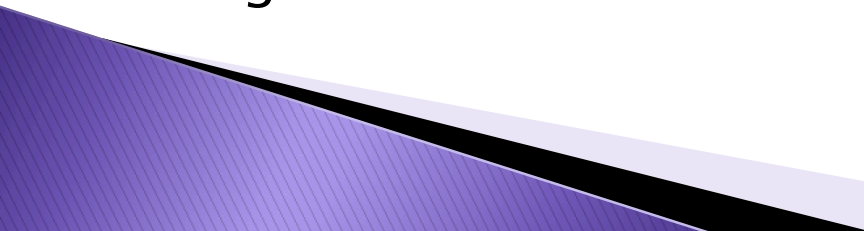

- ▶ Gold standard exact algorithm: Next Subvolume Method (Elf, Ehrenberg, 2004)
- ▶ Problem: Large number of fast diffusive transfers
- ▶ Solution: Aggregate the diffusive transfers
 - Multinomial Simulation Algorithm (*Lampoudi, Gillespie, Petzold 2009*), Diffusive FSP (DFSP) (*Drawert, Lawson, Khammash, Petzold, 2010*)
 - For reaction/diffusion, reactions are incorporated by operator splitting
 - Fewer communication events, more computation between communication events

Complicated Geometries and Unstructured Meshes

- ▶ Early work on complicated geometries (*Isaacson & Peskin, 2006*)
- ▶ Unstructured meshes and complicated geometries (*Engblom, Ferm, Hellander, Lötstedt, 2009*)
- ▶ Adaptive hybrid method, reactions by operator splitting (*Ferm, Hellander, Lötstedt, 2009*)

Common Characteristics of Biochemical Simulations

- ▶ Often begins with an ODE model
 - ▶ Independent models of subcellular mechanisms may be developed and combined later
 - ▶ Spatial stochastic simulation, rare event characterization, and/or stochastic parameter estimation may be employed
 - ▶ Many of the rate parameters are unknown (or known only to an order of magnitude or two)
 - ▶ Global parameter sweeps may be done to determine overall behavior as well as regions of parameter space of particular interest
 - ▶ Large amounts of data are generated and need to be analyzed
- 

StochSS: Stochastic Simulation as a Service

Integrated Development Environment

- ▶ Build a model(s) – multiphysics
- ▶ Scale it up to increasing levels of complexity
- ▶ Explore the parameter space
- ▶ Seamlessly deploy the appropriate computing resources as needed
- ▶ Building on Powerful Existing Tools:
 - StochKit2, PyURDME, ODE and sensitivity
- ▶ Available for Mac, Linux and Windows at

www.stochss.org

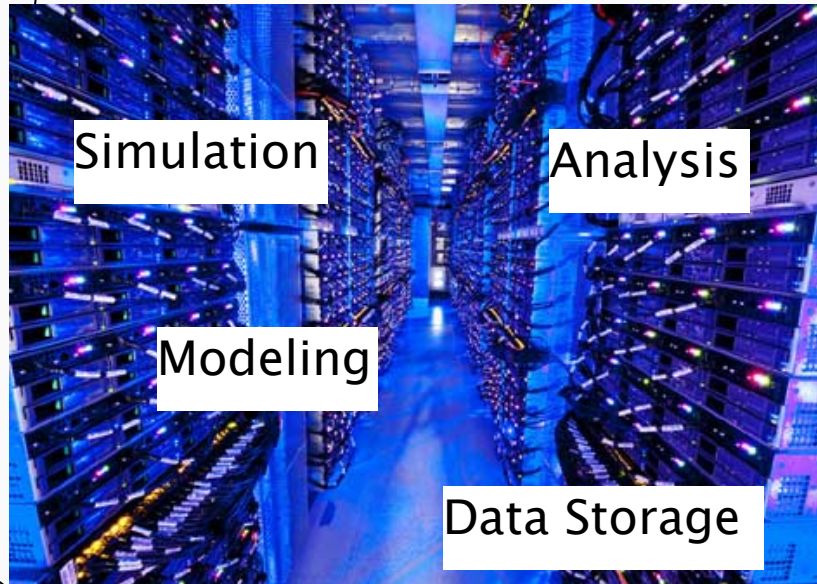

Version 1.6 supports ODE and well-mixed stochastic simulation via StochKit2, parameter estimation for discrete stochastic systems, spatial stochastic simulation via PyURDME

StochSS: Simplifying Large-Scale Stochastic Simulation and Data Analysis

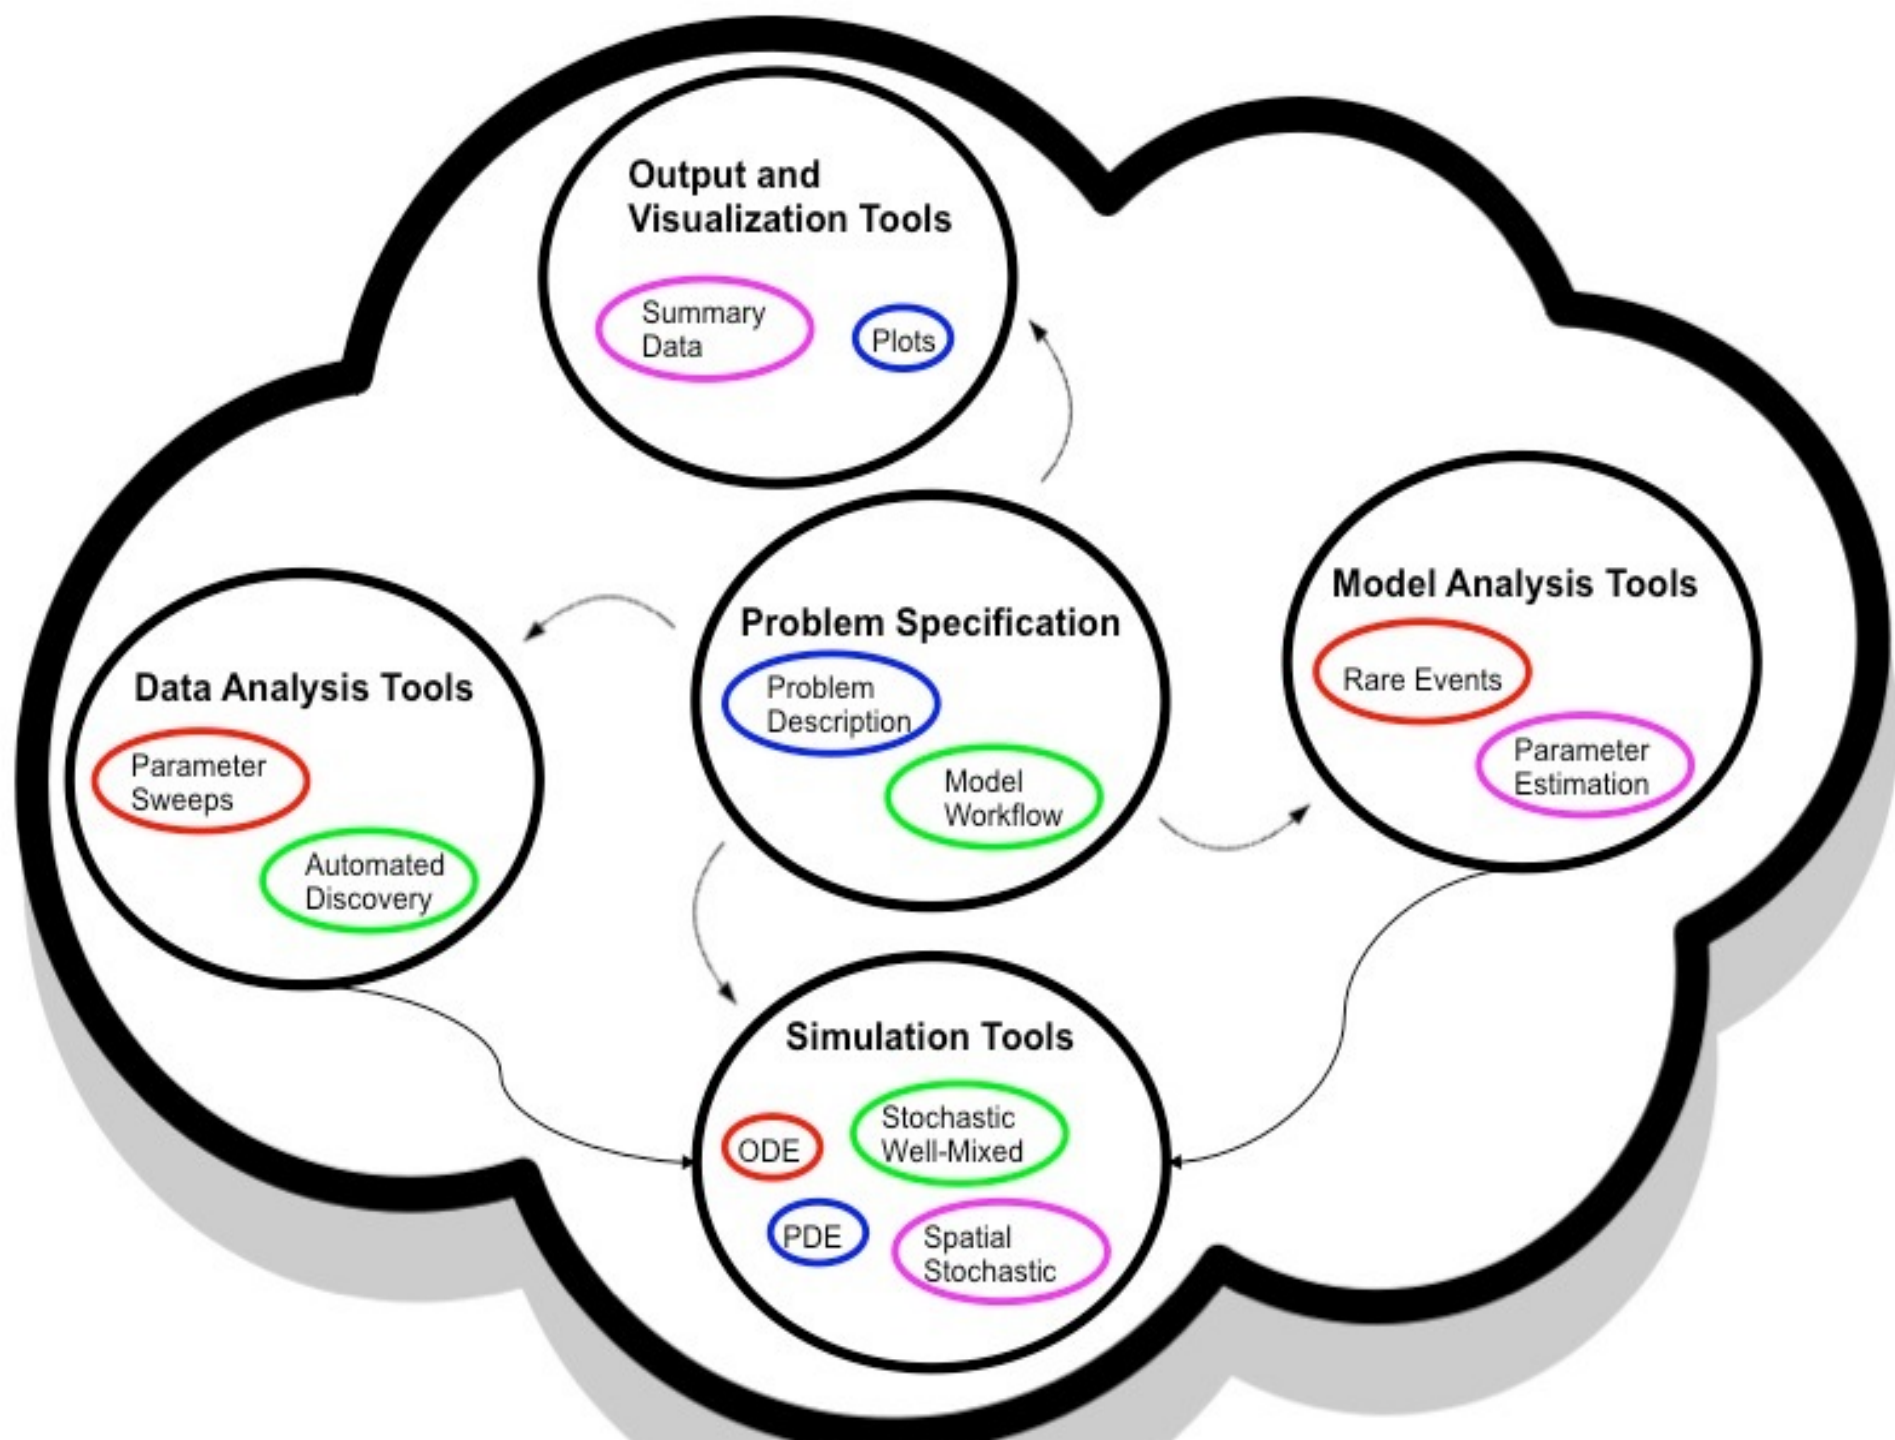

Run Locally

- Deploy small jobs locally
- Experiment and explore
- Visualize/download results

Run Via Cloud

- Deploy large jobs, store large datasets
- Trade-off time and monetary cost
- On-premise or public clouds

StochSS v1.6 Example

Letters to Nature

Nature **403**, 339-342 (20 January 2000) | doi:10.1038/35002131; Received 15 September 1999;
Accepted 23 November 1999

Construction of a genetic toggle switch in *Escherichia coli*

Timothy S. Gardner^{1,2}, Charles R. Cantor¹ & James J. Collins^{1,2}

$$\frac{du}{dt} = \frac{\alpha_1}{1 + v^\beta} - u$$

$$\frac{dv}{dt} = \frac{\alpha_2}{1 + u^\gamma} - v$$

Spatial Stochastic Simulation with StochSS

- ▶ Integration of PyURDME
- ▶ Easy to build spatial models
- ▶ Local and Cloud execution
- ▶ Interactive dynamic visualization with WebGL
 - Three.js library

PyURDME

Python framework for Spatial Stochastic Modeling and Simulation with complex geometries

► Features

- Easy model development using Python
- FEniCS/Dolfin library for geometry and meshing
- Fast efficient solvers written in C
- Exact and approximate algorithms:
 - NSM
 - DFSP (w/GPU)
 - Hybrid Methods
- Extensible solver interface

Drawert, Engblom, Hellander, 2012

PyURDME Example:

MinD Oscillations in *E. coli*

- ▶ Cell division in *E. coli* is regulated by polar oscillations of MinD protein.
 - Act to inhibit enzymes that sever the cell wall
- ▶ Pole-to-pole oscillations force the temporal average of MinD to be high at the poles and low at the cell center
 - Cells always divide at the center
 - Cells only divide when they grow large enough for oscillations to form

Fange et al. (2006)

Highlight Subdomains

1 2

Species Editor

Define species and their spatial properties. Species have a single diffusion coefficient for the entire model, but can be limited to only diffuse into certain subdomains.

Name	Diffusion coefficient	Active in subdomains	
<input type="text" value="MinD_m"/>	<input type="text" value="1e-14"/>	1 <input type="checkbox"/> 2 <input checked="" type="checkbox"/>	<input type="button" value="x"/>
<input type="text" value="MinD_c_atp"/>	<input type="text" value="2.5e-12"/>	1 <input checked="" type="checkbox"/> 2 <input checked="" type="checkbox"/>	<input type="button" value="x"/>
<input type="text" value="MinD_c_adp"/>	<input type="text" value="2.5e-12"/>	1 <input checked="" type="checkbox"/> 2 <input checked="" type="checkbox"/>	<input type="button" value="x"/>
<input type="text" value="MinD_e"/>	<input type="text" value="2.5e-12"/>	1 <input checked="" type="checkbox"/> 2 <input checked="" type="checkbox"/>	<input type="button" value="x"/>
<input type="text" value="MinDE"/>	<input type="text" value="1e-14"/>	1 <input type="checkbox"/> 2 <input checked="" type="checkbox"/>	<input type="button" value="x"/>

Initial Conditions Editor

Define the initial conditions for a spatial simulation.

- A 'Scatter' initial condition distributes 'Count' particles over the chosen subdomain.
- A 'Place' initial condition places 'Count' particles at a given X, Y, Z coordinate.

• A 'Distribute Uniformly' initial condition puts 'Count' particles in each voxel of the chosen subdomain.
