University of Southern California

MSM Consortium Meeting
4 September 2013

Angiogenesis

- Formation of new capillaries from pre-existing blood vessels
- Important in developing and adult animals
- Governed by a balance of promoters and inhibitors

Physiological

Organ development

Reproduction

Wound healing

Exercise

Pathological

Cancer

Retinopathy

Arthritis

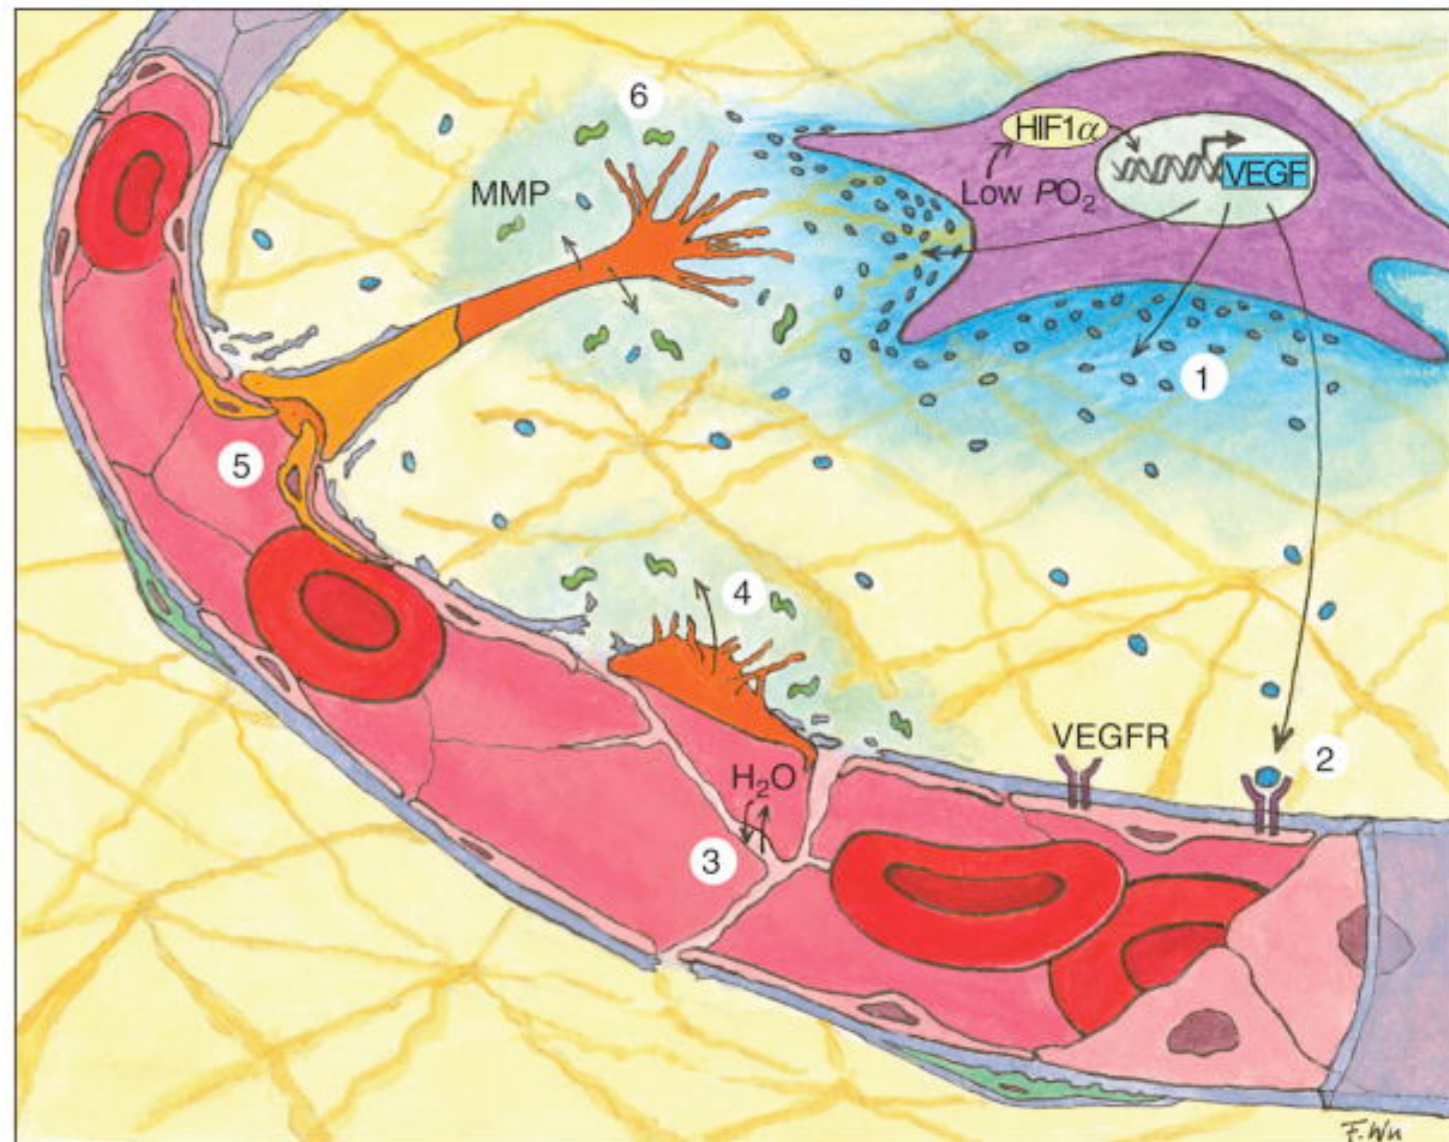

Peripheral artery disease

Stroke

...

VEGF family: target for cancer therapy

- **V**ascular **E**ndothelial **G**rowth **F**actor (VEGF)
 - Potent regulator of angiogenesis
 - Acts in response to many stimuli, including hypoxia
 - Stimulates cell proliferation, migration, and survival
- **Targeted in cancer therapies**

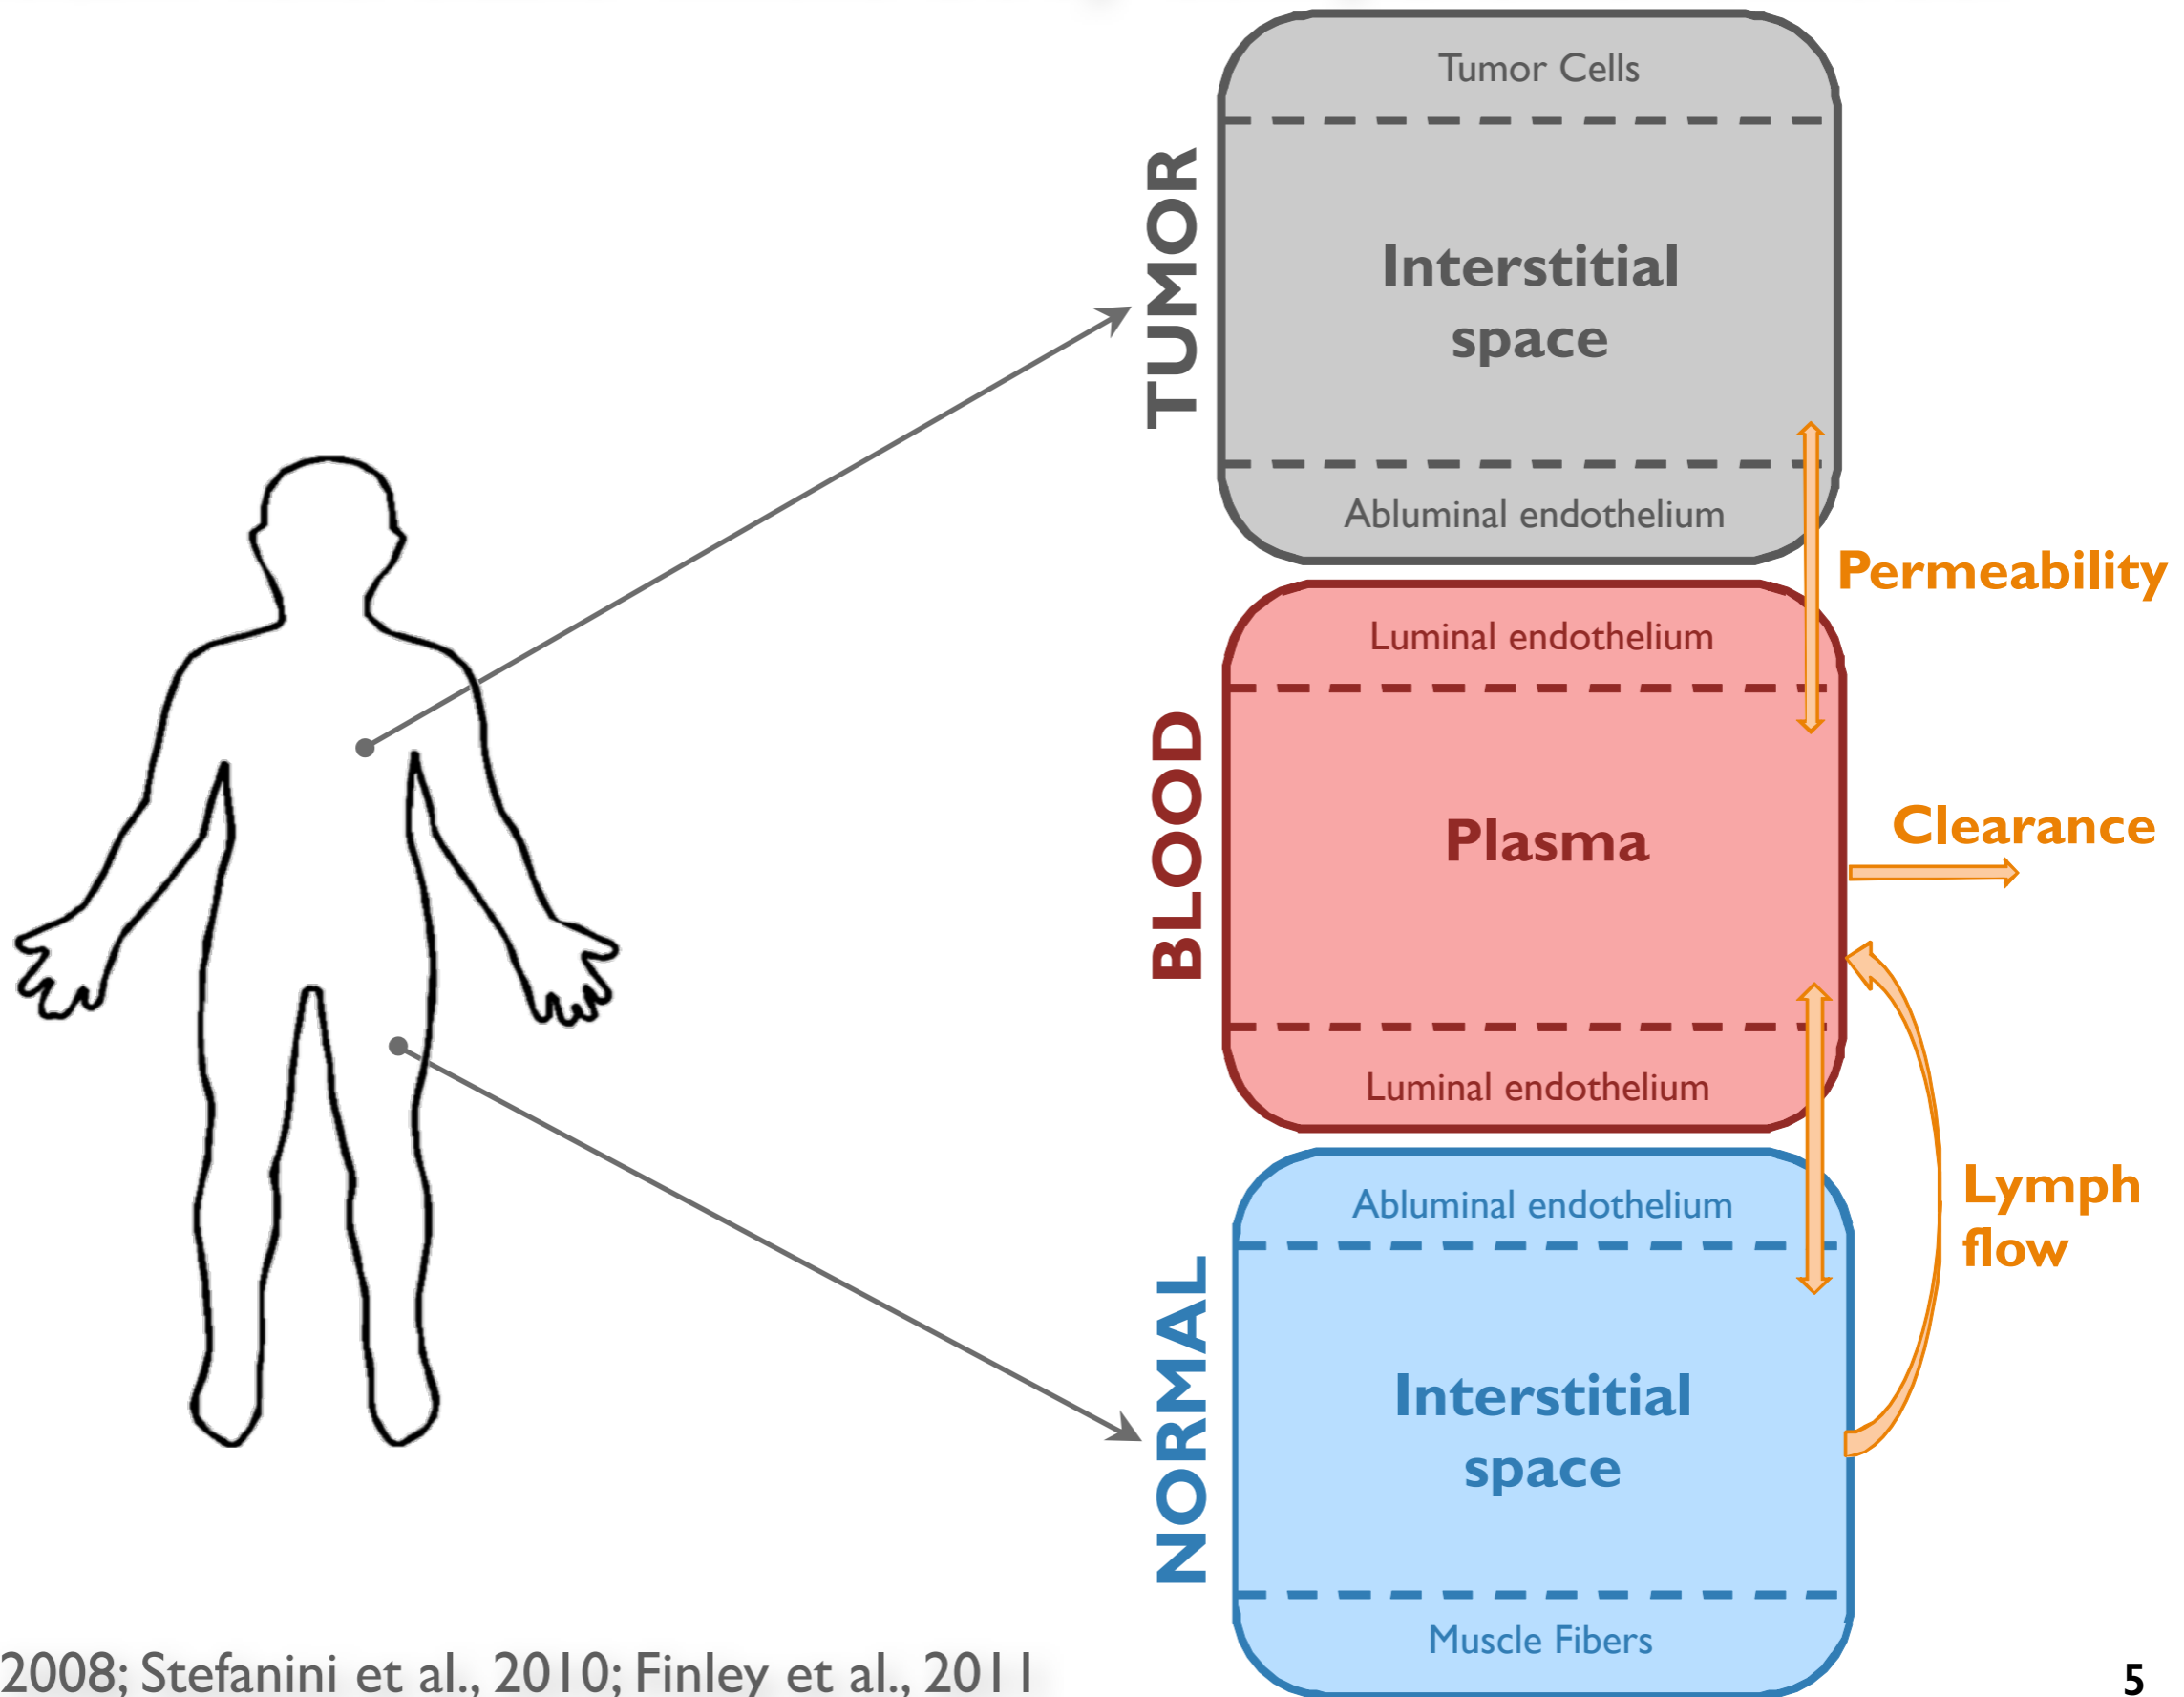

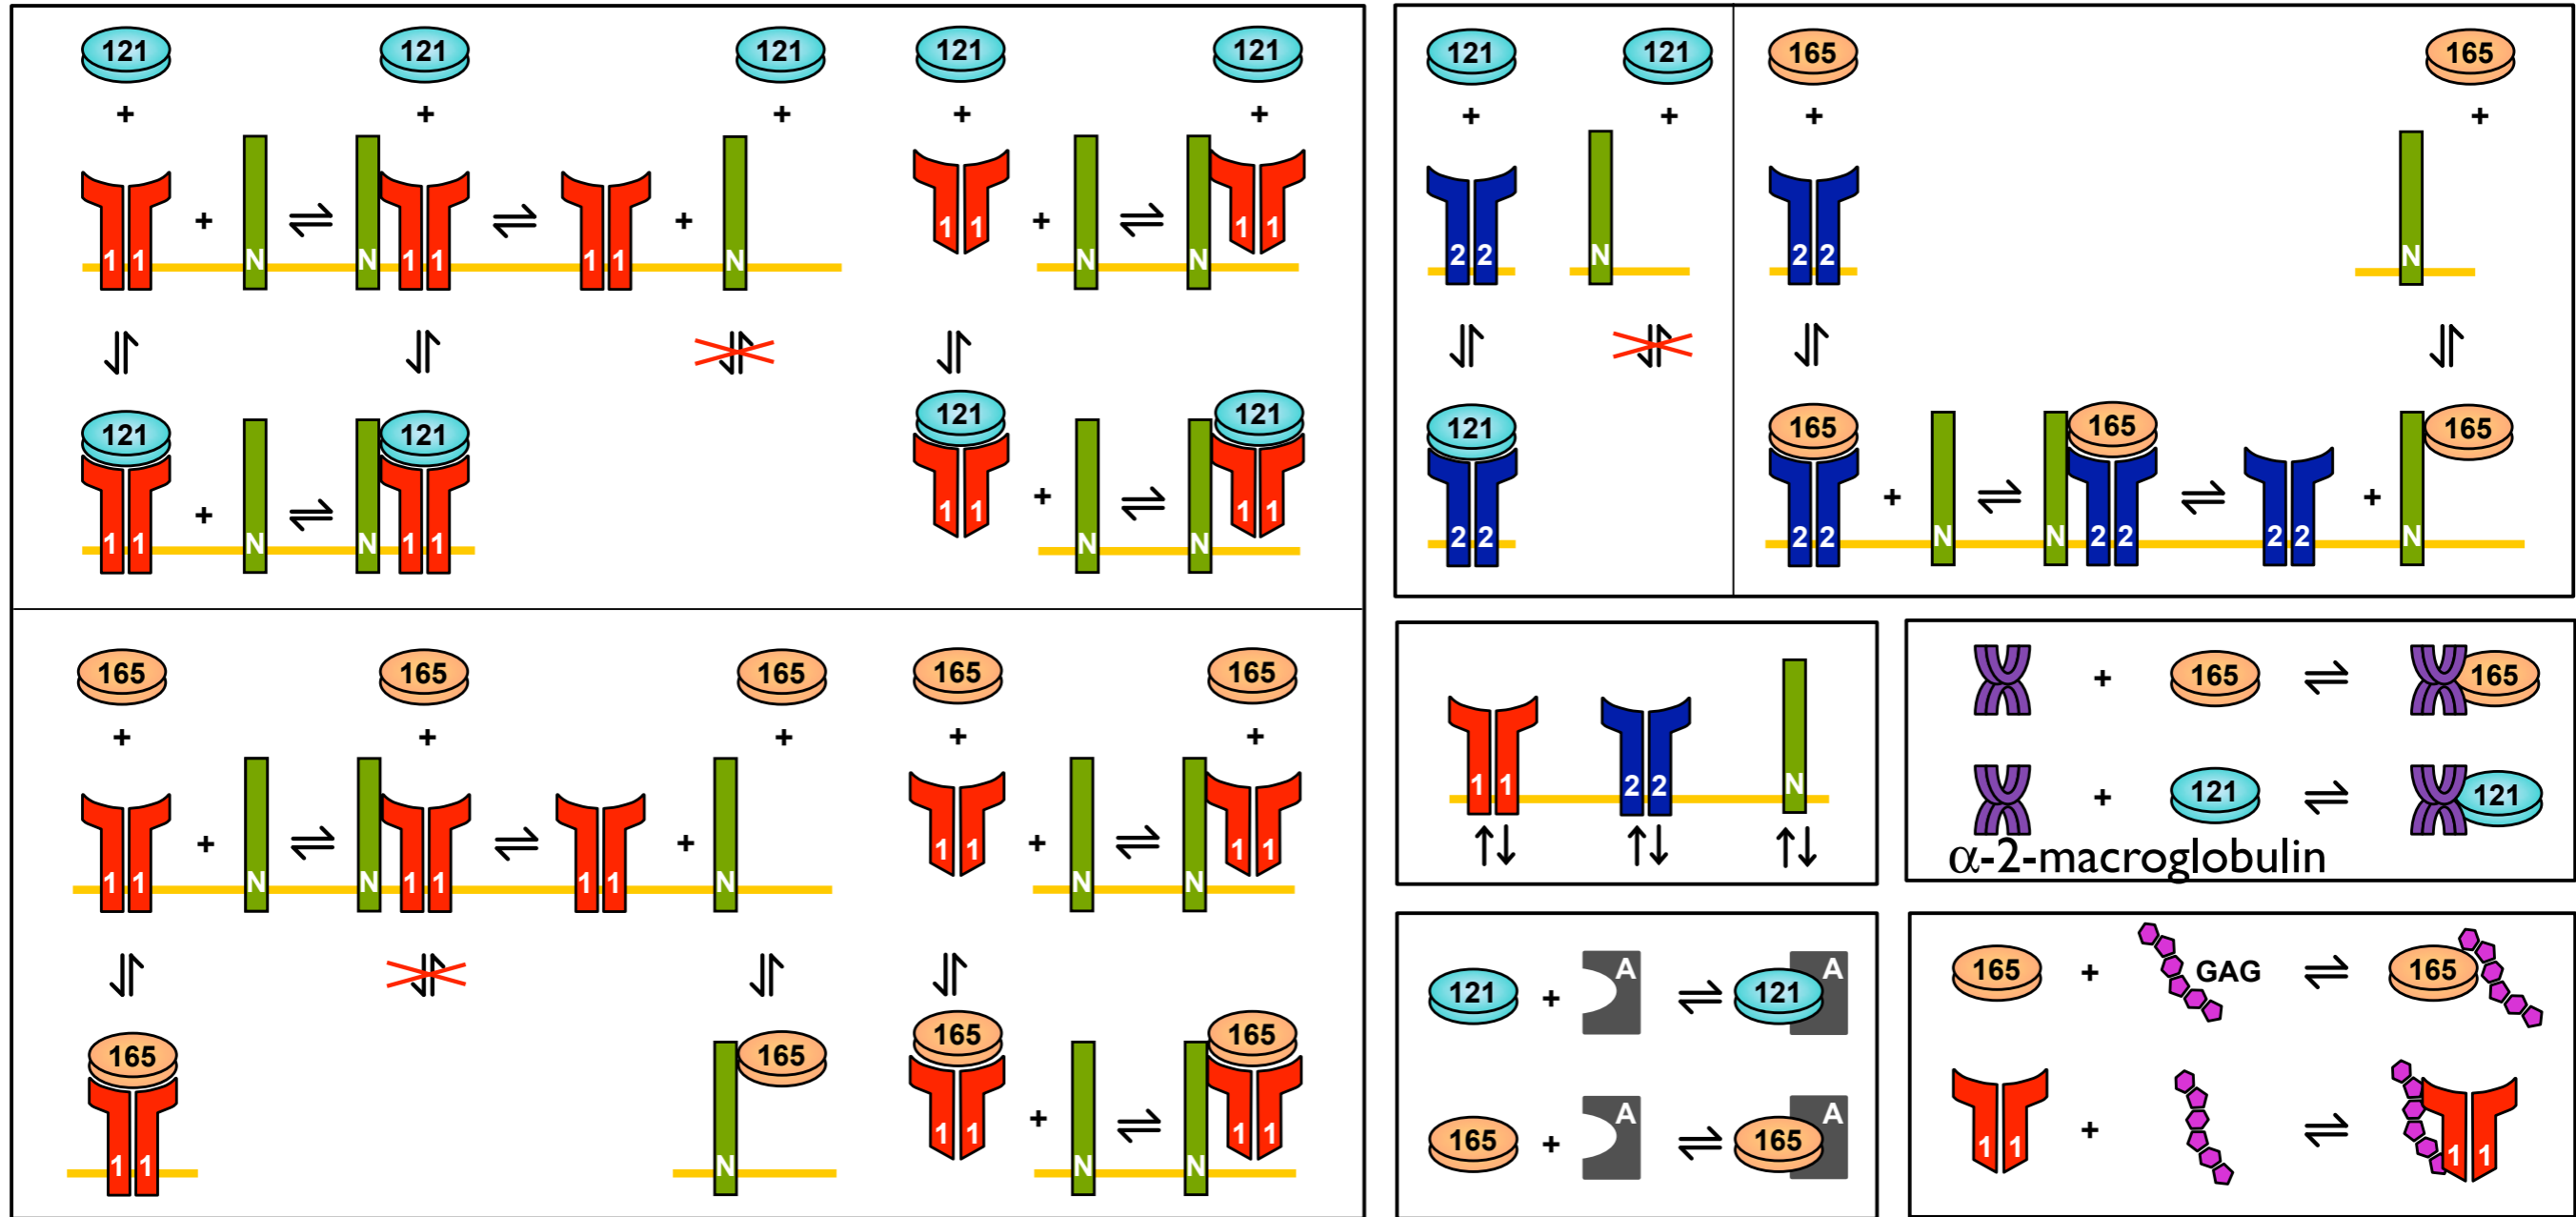

VEGF family: prime for systems biology modeling

We have developed a **molecular-detailed computational model of VEGF** to **predict the effect of therapeutics** that target the VEGF pathway

Methods: Multi-scale whole-body compartment model

Model includes 154 ODEs to predict the concentrations of all molecular species in each compartment

Simulating VEGF-targeted therapy

Model predicts response to anti-VEGF treatment

Model predicts response to anti-VEGF treatment

Plasma VEGF initially **decreases**, and then **rebounds above the pretreatment level**

Explanation of response to anti-VEGF therapy

Phase I: Depletion of plasma and interstitial free VEGF

Phase II: Recovery of plasma VEGF

Explanation of response to anti-VEGF therapy

Phase I: Depletion of plasma and interstitial free VEGF

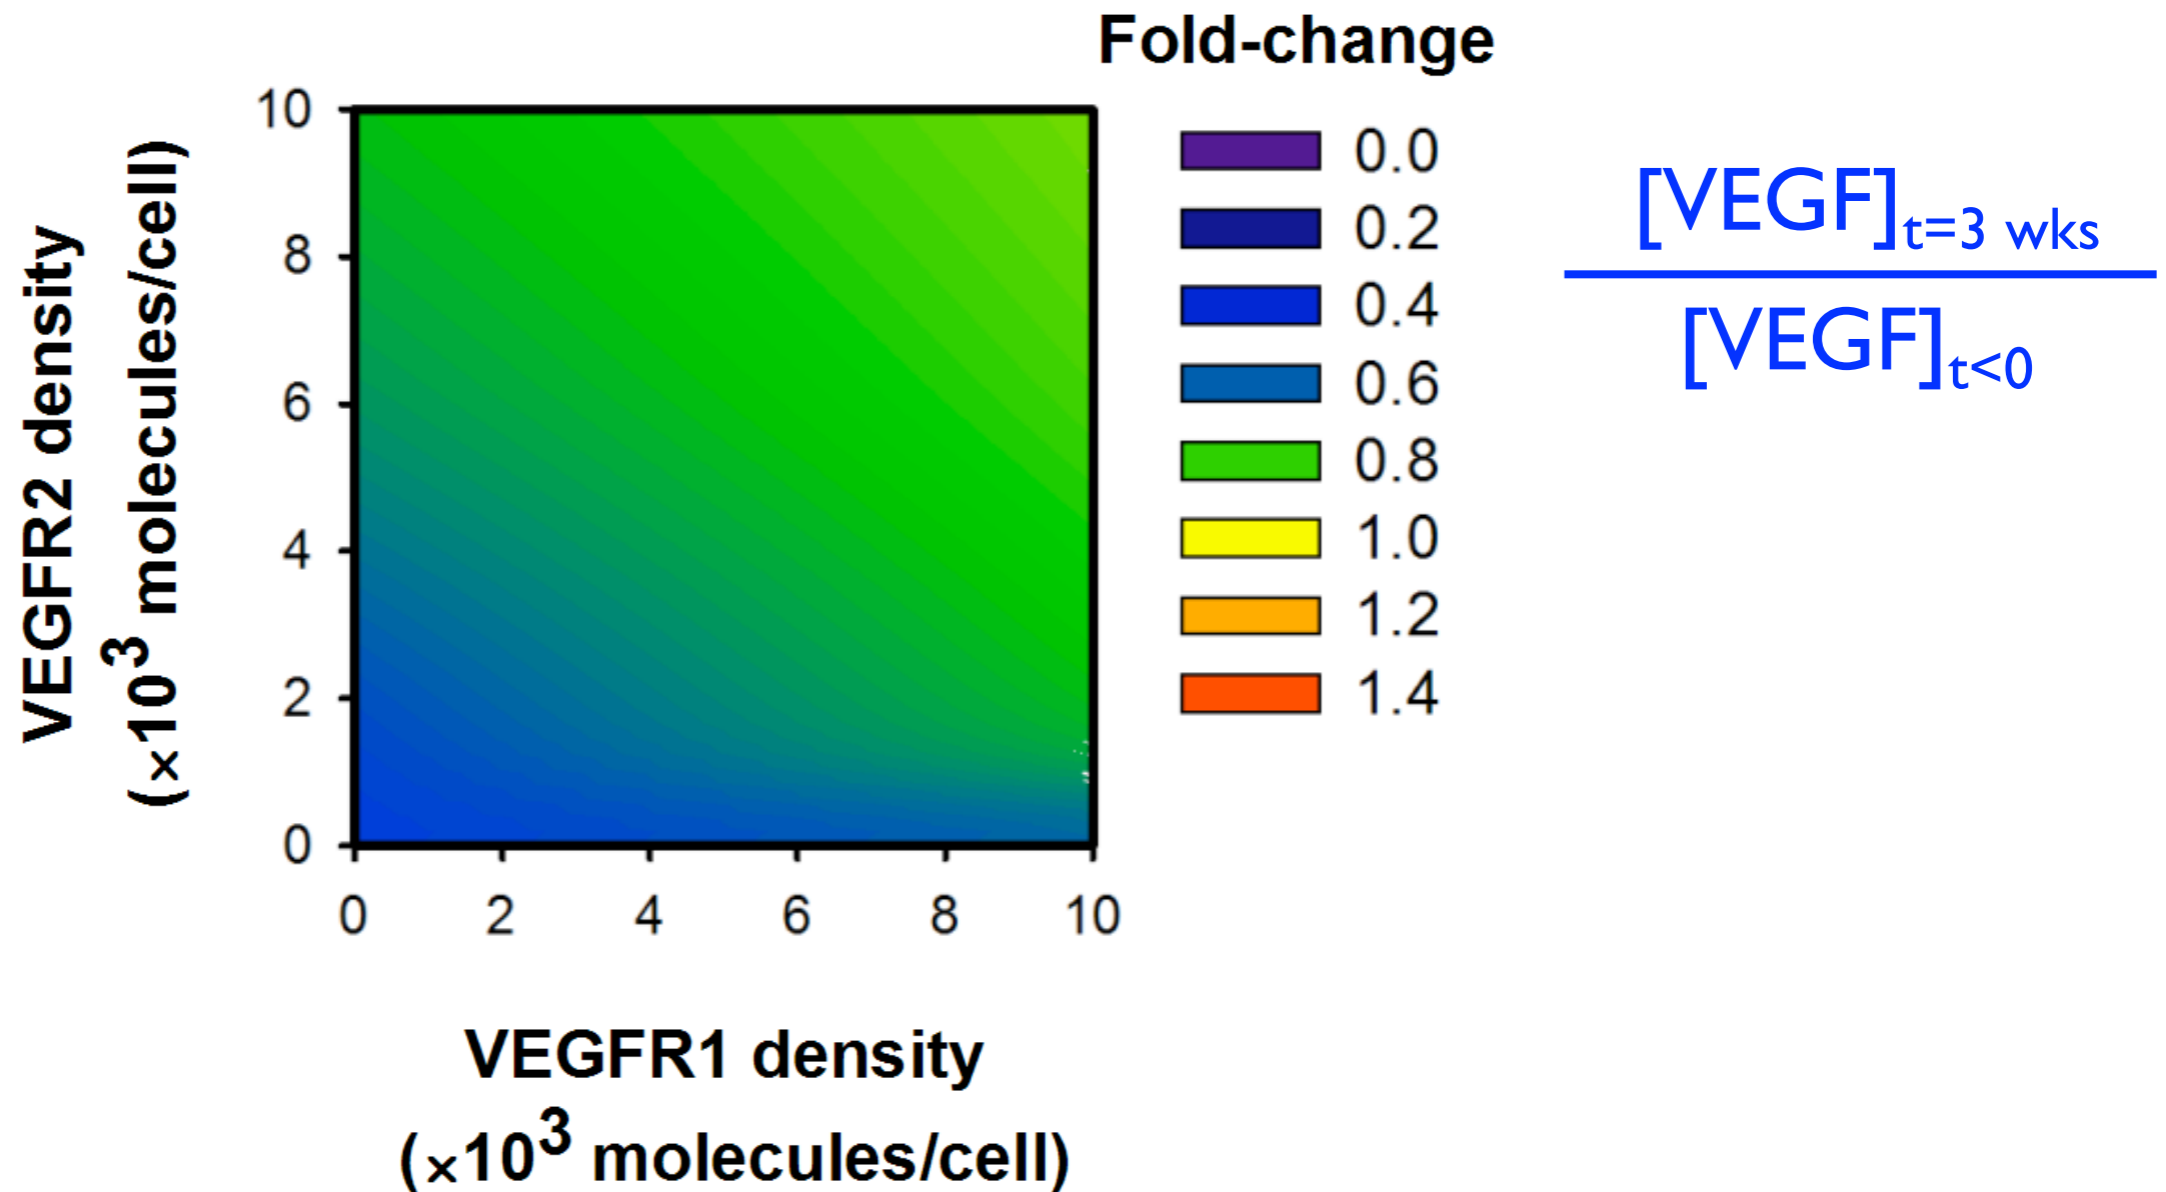

**The model explains
clinical observations**

Quantifying the effect of treatment

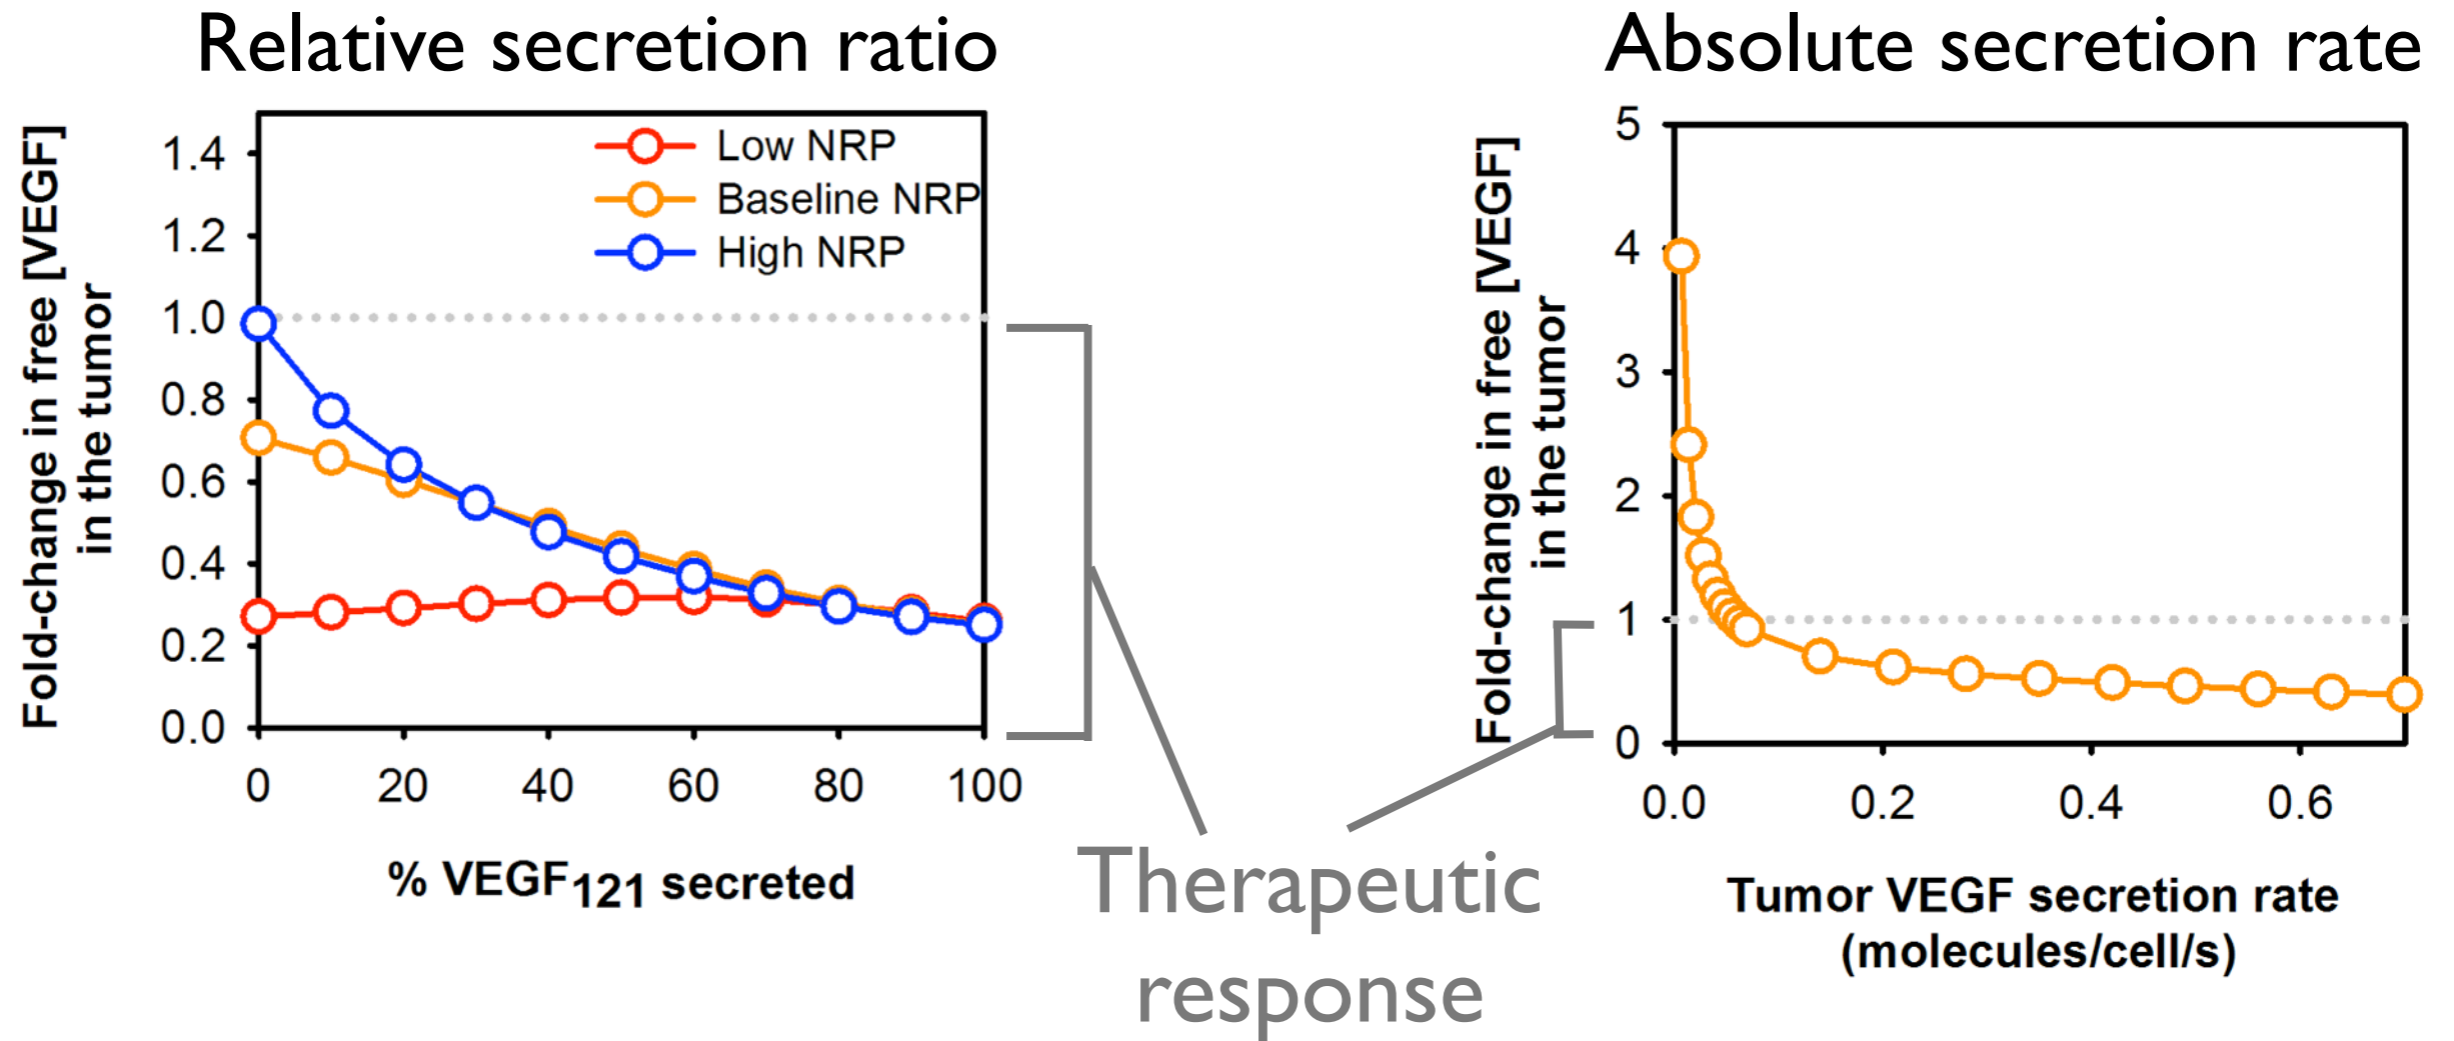

- “**Fold-change**” of free (unbound) VEGF in the tumor
 - Compares free VEGF before treatment and VEGF at 3 weeks post-treatment
 - Fold-change =
$$\frac{[\text{VEGF}]_{t=3 \text{ wks}}}{[\text{VEGF}]_{t<0}}$$
- Values of the fold-change:
 - = 1: No change
 - > 1: Free VEGF increased
 - < 1: Free VEGF decreased, “**therapeutic response**”

Effect of receptor expression on tumor cells

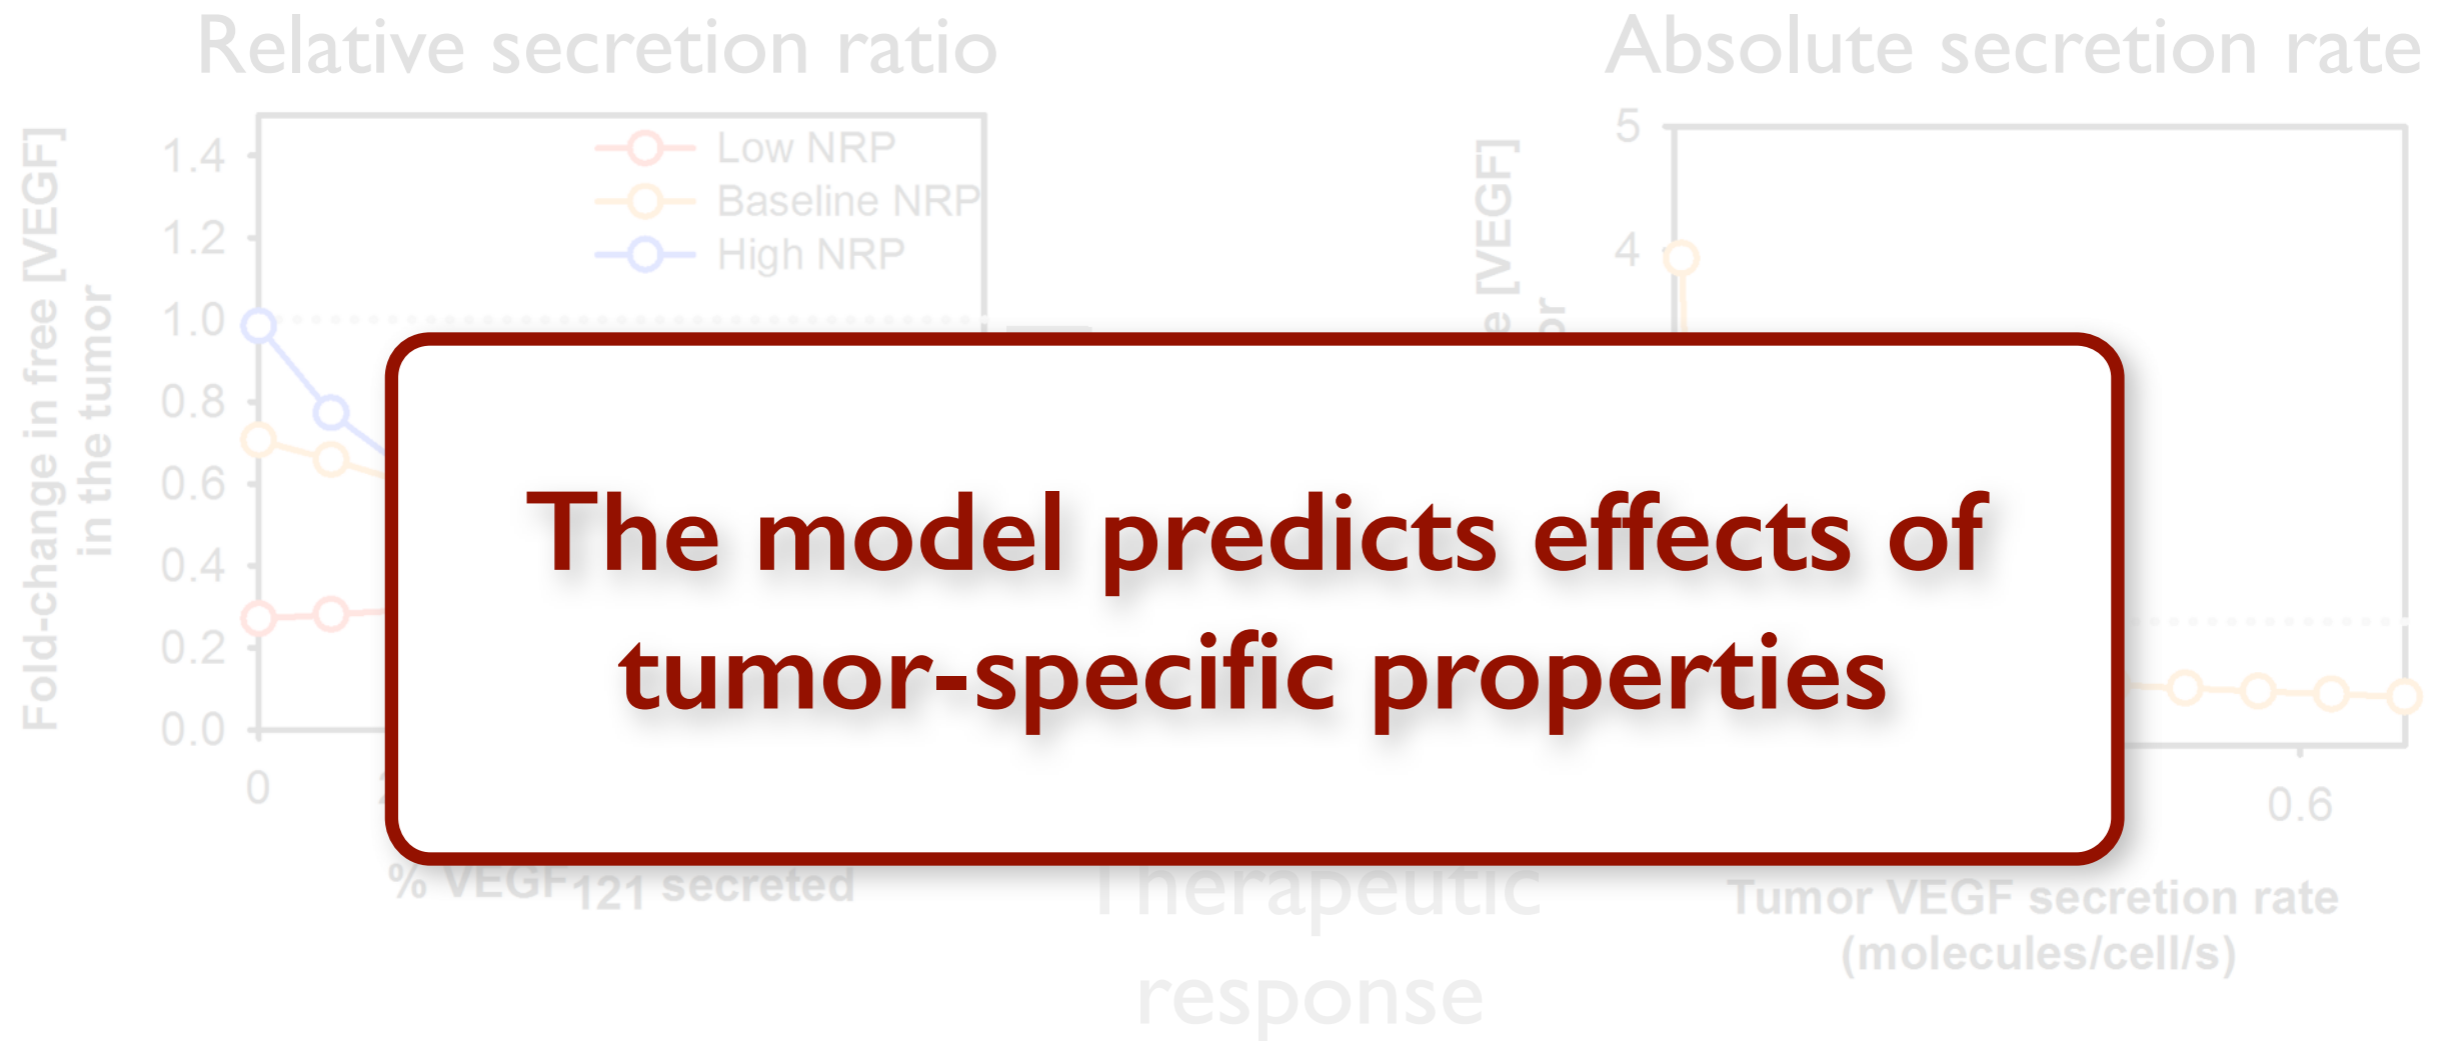

Tumor VEGF is **depleted** following anti-VEGF treatment

Effect of tumor secretion of VEGF

Response of tumor VEGF depends on tumor microenvironment

Effect of tumor secretion of VEGF

Response of tumor VEGF depends on tumor microenvironment

Effect of tumor secretion of VEGF

Response of tumor VEGF depends on tumor microenvironment

Explanation of response to anti-VEGF therapy

Phase I: Depletion of plasma and interstitial free VEGF

Phase II: Recovery of plasma VEGF

Phase III: Recovery of tumor interstitial VEGF

Explanation of response to anti-VEGF therapy

Phase I: Depletion of plasma and interstitial free VEGF

Phase III: Recovery of tumor interstitial VEGF

Conclusions

- The model predicts the **level of tumor VEGF** following anti-VEGF treatment
- Anti-VEGF treatment **robustly decreases interstitial VEGF** for most tumor parameters
- The model predicts that **anti-VEGF therapy may have counter-therapeutic effect** for some tumors
- Clinical applications:
 - Anti-VEGF mechanism of action
 - Personalized medicine
